METEOROLOGISCH JAARBOEK VOOR 1894.

UITGEGEVEN DOOR HET

Koninklijk Nederlandsch Meteorologisch Instituut.

ZES EN VEERTIGSTE JAARGANG.

ANNUAIRE MÉTÉOROLOGIQUE POUR 1894.

PUBLIÉ PAR

l'Institut Royal Météorologique des Pays-Bas.

QUARANTE-SIXIÈME ANNÉE.

UTRECHT,

J. VAN BOEKHOVEN.

1896.

Te verkrijgen bij H. G. BOM, Zeevaartkundige boekhandel.

Warmoesstraat 35 Amsterdam.

*LIBRARY OF THE
LELAND STANFORD JR. UNIVERSITY.*

Q.37504.

INHOUD.

<u>Lijst van waarnemingenstations in Nederland</u>	<u>Inde</u> <u>x</u>
<u>Voorrede</u>	<u>VII—VIII</u>
<u>Waarnemingen in Nederland in 1894, bevattende:</u>	
<u>Afdeling I. Waarnemingen driemaal daags gedaan te Utrecht, Groningen, Helder, Vlissingen, Maastricht, Hellevorstsluis, Tilburg en Winterswijk</u>	<u>1—96</u>
<u>Afdeling II. Maandoverzichten der driemaal daagsche waarnemingen te Utrecht, Helder, Leeuwarden, Groningen, Assen, Amsterdam, Oude-Weering, Katwijk, Rotterdam, Hellevorstsluis, Vlissingen, Oudenbosch, Tilburg, Maastricht, Zutphen en Winterswijk</u>	<u>97—112</u>
<u>Afdeling III. Waarnemingen omtrent regenhoeveelheden voor $\pm$ 100 stations</u>	<u>113—160</u>
<u>Afdeling IV. Afwijkingen van den thermometer te Groningen, Leeuwarden, Helder, Utrecht, Hellevorstsluis, Vlissingen, Maastricht, Assen en Tilburg en van den barometer te Delfzijl, Groningen, Leeuwarden, Helder, Assen, Amsterdam, Utrecht, Hellevorstsluis, Tilburg, Vlissingen en Maastricht</u>	<u>161—208</u>
<u>Afdeling V. Urwaarnemingen van den thermometer gedaan te Utrecht, Helder en Vlissingen en van den barometer gedaan te Helder, Groningen en Vlissingen, benevens overzichten dier waarnemingen</u>	<u>209—253</u>
<u>Afdeling VI. Bijzondere waarnemingen.</u>	
<u>A. Componenten van den wind te Utrecht</u>	<u>255—296</u>
<u>B. Wind voor 6 plaatsen in Nederland, (Groningen, Helder, Utrecht en Vlissingen)</u>	<u>297—299</u>

TABLE DES MATIÈRES.

<u>Liste des stations météorologiques des Pays-Bas</u>	<u>Page</u> <u>x</u>
<u>Préface</u>	<u>VII—VIII</u>
Observations faites dans les Pays-Bas en 1894, contenant:	
<u>Division I. Observations faites trois fois par jour à Utrecht, Groningue, Helder, Flissingue, Maastricht, Hellevorstsluis, Tilbourg et Winterswijk</u>	<u>1—96</u>
<u>Division II. Revues mensuelles des observations faites trois fois par jour à Utrecht, Helder, Leeuward, Groningue, Assen, Amsterdam, Oude-Weering, Katwijk, Rotterdam, Hellevorstsluis, Flissingue, Oudenbosch, Tilbourg, Maastricht, Zutphen et Winterswijk</u>	<u>97—112</u>
<u>Division III. Observations pluviométriques dans $\pm$ 100 stations</u>	<u>113—160</u>
<u>Division IV. Écarts du thermomètre à Groningue, Leeuward, Helder, Utrecht, Hellevorstsluis, Flissingue, Maastricht, Assen et Tilbourg; et du baromètre à Delfzijl, Groningue, Leeuward, Helder, Assen, Amsterdam, Utrecht, Hellevorstsluis, Tilbourg, Flissingue et Maastricht.</u>	<u>161—208</u>
<u>Division V. Observations horaires du thermomètre, faites à Utrecht, Helder et Flissingue; et du baromètre, faites à Helder, Groningue et Flissingue; et résumés de ces observations</u>	<u>209—253</u>
<u>Division VI. Observations particulières</u>	
<u>A. Composantes du vent à Utrecht</u>	<u>255—296</u>
<u>B. Vent en 6 lieux des Pays-Bas (Groningue, Helder, Utrecht et Flissingue)</u>	<u>297—299</u>

	Bladz.
C. <u>Overzicht van de weersgesteldheid gedurende het jaar 1894.</u> . . .	300—314
D. <u>Verscheiden uit het planten- en dierenrijk en betreffende den landbouw.</u>	315—324
E. <u>Jaaroverzicht.</u>	325—341
Afdeling VII. <u>Magnetische waarnemingen te Utrecht.</u>	343—374
Aanhangsel. <u>Waarnemingen buiten Nederland hoofdzakelijk in 1894, betreffende:</u> <u>Waarnemingen driemaal daags gedaan te <i>Barasidé</i>, <i>Coronie</i>, <i>Kolonie Suriname (Zuid-Amerika)</i> te <i>Brassaville</i>, <i>Stanley-Pool</i> (<i>Congo Français</i>), te <i>Ouesso</i> (<i>Congo Français</i>), te <i>Loranga</i> (<i>Congo Français</i>) en te <i>Factory „Wilhelmina“</i> (<i>N° Goko-rivier</i>).</u>	1—XXX

Lijst van ingekomen boekwerken en tijdschriften in 1894. XXXI—XXXV

Dr. VAN RIJCKEVORSEL. Jaarlijksche gang der temperatuur te Vlissingen. 1^o—16^o

	Page.
C. <u>Revue du temps pendant l'année 1894.</u>	300—314
D. <u>Phénomènes périodiques des animaux, des végétaux et de l'agriculture.</u>	315—324
E. <u>Résumé.</u>	325—341
Division VII. <u>Observations magnétiques à Utrecht.</u>	343—374
Appendice. <u>Observations faites à l'étranger en 1894, contenant:</u> <u>Observations faites trois fois par jour à <i>Barasidé</i>, <i>Coronie</i>, <i>Kolonie Suriname (Amérique du Sud)</i>, à <i>Brassaville</i>, <i>Stanley-Pool</i>, (<i>Congo Français</i>), à <i>Ouesso</i> (<i>Congo Français</i>), à <i>Loranga</i> (<i>Congo Français</i>) et à <i>Factory „Wilhelmina“</i> (<i>N° Goko-rivier</i>).</u>	1—XXX

VOORREDE.

Bij het verschijnen van het 46^{te} deel van dit Jaarboek is niet anders te vermelden, dan dat de inrichting geheel dezelfde gebleven is als die van den voorgaanden jaargang, behalve dat op pag. 8, 16, enz. in plaats van de onvolledige tabellen voor de stations *Delfzijl*, *Amsterdam* en *Leenwarden*, eene volledige tabel voor het nieuwe station *Winterswijk* is opgenomen. De weggevallen stations zijn nu nog alleen in de Maandoverzichten vertegenwoordigd.

De berekening van Tabel **L** van het Jaaroverzicht is nu geheel geschied overeenkomstig hetgeen daaromtrent op pag. XXVIII van den vorigen jaargang gezegd is en tengevolge daarvan, het opschrift van de rechterhelft van die tabel eenigszins veranderd.

De **magnetische waarnemingen** zijn uitgebreid, zoodat ook nu de uurwaarnemingen der horizontale intensiteit in dit Jaarboek voorkomen.

In het **aanhangselsel** zijn vervallen de waarnemingen: te *Yakoma* (Congo français), te *Krokodilrijdt* en *Komatigpoort*, daarvoor in de plaats zijn getreden de waarnemingen: te Factory « *Wilhelmina* » (N° Goko-rivier).

Overigens raadplege men dus omtrent de inrichting van het Jaarboek hetgeen daaromtrent in de Inleiding van den vorigen Jaargang gezegd is.

In de instrumenten en de methoden van waarneming is geen verandering van noemenswaardige beteekenis gekomen.

Evenals de laatste jaren volgt hier eene tabel tot vergelijking der temperatuur-waarnemingen te 8 u. 's morgens op het NW-plat gedaan met die van hetzelfde uur, verricht met het instrument, dat van

PRÉFACE.

En publiant le 46^e volume de cet Annuaire, nous n'avons pas autre chose à dire, sinon que son ordonnance est restée tout à fait la même que celle de l'année précédente, sauf qu'au lieu des tableaux incomplets pour les stations de *Delfzijl*, d'*Amsterdam* et de *Leenwarden*, on trouve aux pages 8, 16, etc. un tableau complet pour la nouvelle station de *Winterswijk*. Les stations éliminées ne se trouvent plus représentées que dans les Aperçus mensuels.

La table **L** de l'Aperçu annuel a été calculée tout à fait de la manière indiquée à la page XXVIII de l'Annuaire précédent; c'est pourquoi la suscription de la moitié droite de cette table a été un peu modifiée.

Les **observations magnétiques** ont été augmentées, de sorte qu'on trouvera maintenant dans cet Annuaire les observations horaires de l'intensité horizontale.

On ne trouvera plus au **supplément** les observations de *Yakoma* (Congo français), de *Krokodilrijdt* et de *Komatigpoort*; elles ont été remplacées par celles faites à la Factorie « *Wilhelmina* » (N° Goko-rivier).

On peut consulter l'Introduction de l'Annuaire précédent pour ce qui regarde l'ordonnance de celui-ci.

Il n'y a eu de changements notables ni dans les instruments ni dans les méthodes d'observation.

Nous donnons ci-dessous, comme les dernières années, une table de comparaison entre les observations de température faites à 8 heures du matin, sur la terrasse NW, et celles qui ont été faites à la même

oudsher voor de waarnemingen gediend heeft. Ontrent de verklaring der tabel en de beweegreden tot het doen dezer waarnemingen, zie men de Voorrede van den vorigen Jaargang.

beure avec l'instrument dont on s'est servi depuis de longues années pour ces observations. Pour l'explication de cette table et les raisons qui nous ont porté à faire ces observations, nous renvoyons à la Préface de l'Annuaire précédent.

C. OVERZICHT

VAN DE WEERSGESTELDHEID GEDURENDE HET JAAR 1894.

JANUARI.

De eerste dagen van Januari waren aanmerkelijk veel te koud; haarentegen was na den 9^{ten} de temperatuur, slechts op twee dagen uitgezonderd, min of meer boven de normale, zoodat ten slotte de gemiddelde maandelijksche temperatuur $0^{\circ}.32$ C. boven het veeljarig gemiddelde $1^{\circ}.13$ C. is. De laagste temperatuur $-14^{\circ}.3$ C. werd op den 5^{den} Januari waargenomen; deze verschilt weinig van den in het vorige jaar bereikten minimum-stand van $-14^{\circ}.6$ C. De hoogste temperatuur in de afgelopen maand bedroeg $7^{\circ}.8$ C.

De normale stand van den barometer is in Januari 760.2 mm.; dit jaar was hij gemiddeld 759.3 mm., terwijl de veranderingen plaats grepen tusschen de grenzen van 775.2 en 747.4 mm.

De relative vochtigheid (87%) was iets grooter dan het veeljarig gemiddelde (85.2%). De hoogte van den neerslag, op 16 dagen gevallen, bedraagt 52.8 mm., dus iets meer dan de normale hoeveelheid 48.5 mm. Op 5 dagen sneeuwde het.

Januari leverde 7 bewolkte en 2 heldere dagen op, terwijl de gemiddelde bewolking 5.7 bedroeg, iets minder dan het veeljarige gemiddelde 6.5.

Noordenwind kwam niet voor, het veelvuldigst was de wind ZZW. vervolgens Z. en ZW.

C. REVUE

DU TEMPS PENDANT L'ANNÉE 1894.

JANVIER.

Les premiers jours de ce mois ont été beaucoup trop froids; mais, après le 9, la température fut plus ou moins au-dessus de la normale, sauf pendant deux jours, de sorte que la température moyenne de ce mois-ci a été en définitive de $0^{\circ}.32$ centigrades au-dessus de la moyenne de nombreuses années, $1^{\circ}.13$. La température la plus basse, $-14^{\circ}.3$, fut observée le 5 Janvier; elle diffère très peu de celle observée l'année dernière, qui fut de $-14^{\circ}.6$. La plus haute température de ce mois a été de $7^{\circ}.8$.

La hauteur normale du baromètre pour le mois de Janvier est de 760.2 millim.; la moyenne a été cette année de 759.3 millim., et la colonne barométrique oscilla entre 775.2 et 747.4 millimètres.

L'humidité relative (87%) fut un peu plus grande que la moyenne d'un grand nombre d'années (85.2%). La hauteur des eaux pluviales, tombées pendant 16 jours, a été de 52.8 millim., donc un peu supérieure à la quantité normale, 48.5 millim. Il y eut 5 jours de neige.

Janvier a eu 7 jours couverts et 2 jours serains, tandis que la nébulosité moyenne fut de 5.7, un peu moindre que la moyenne, 6.5, d'un grand nombre d'années.

Il n'y eut pas de vent du nord; les vents les plus fréquents furent ceux du sud-sud-ouest, du sud et du sud-ouest.

De kracht van den wind was over het algemeen gering. Hiervan is het gevolg, dat de gemiddelde windkracht slechts 3.48 KG. bedraagt. In den avond van den 27^{ten} Januari vindt men een maximum drukking van 20 KG.

Gedurende de afgelopen maand zijn te Utrecht drie kringen om de zon en een om de maan zichtbaar geweest, terwijl driemaal een kranen om de maan werd waargenomen.

FEBRUARI

De afgelopen maand heeft een slechten indruk achtergelaten, want hoewel er 4 heftige dagen voorkwamen, en het normale aantal slechts 2 is, heeft zij 10 bewolkte dagen opgeleverd, terwijl dit gemiddeld maar 4.3 bedraagt. De gemiddelde bewolking was 5.9, dus kleiner dan het normale bedrag, 6.3.

Aan regendagen ontbrak het niet: Februari leverde er 20, terwijl er op 17 meer dan 0.5 mm. regen viel. Normaal is 17 dagen met neerslag, en 12 met meer dan een halve mm. De regen werd op drie dagen vervangen door sneeuw en eens door hagel.

De barometer wisselde af tusschen 776.9 en 742.1 mm., de gemiddelde stand was 761.6, dus hooger dan de normale stand 759.6.

Op 10 dagen van de maand was het te koud, toch ten slotte was de gemiddelde temperatuur 3^o.8 hooger dan het normale gemiddelde, 2^o.9 C. De maximum-temperatuur dezer maand bedroeg 14^o.5 en de minimum —7^o.2 C. Op 8 dagen was de temperatuur beneden het vriespunt, maar slechts voor 2 bleef zij den geheelen dag hieronder.

De maand was in het algemeen genomen te vochtig, de gemiddelde relatieve vochtigheid bedroeg 88 %, terwijl het normale bedrag 86,2 % is.

De maand Februari kenmerkte zich door vele windstijlen, afgewisseld door krachtigen wind. De windrichting varieerde hoofdzakelijk tusschen ZZO. en WNW. het veelvuldigst was de ZW-wind. Tot 12 Februari hield het gebied van hege drukking bij slechts geringe verplaatsing in het zuiden van Europa stand, en volgden verschillende depressies, die zich langs de kust van Schotland en over Scandinavië verplaatsten, elkander op.

La force du vent fut en général faible, ce qui fait que la moyenne de la force du vent n'est que de 3.48 kilogrammes. Dans la soirée du 27 Janvier, on observa une pression maximum de 20 kilogr.

A Utrecht, on observa pendant ce mois trois fois un halo autour du soleil et une fois autour de la lune, tandis qu'on vit trois fois une couronne autour de la lune.

FEVRIER.

Le mois a laissé une mauvaise impression, car bien qu'il ait eu 4 jours serains contre une moyenne de 2, il a eu en revanche 10 jours couverts, tandis que la moyenne n'est que de 4.3. La nébulosité moyenne a été 5.9, par conséquent plus petite que la normale, 6.3.

Les jours de pluie ne manquèrent pas; ce mois-ci en compte 20; tandis que dans 17 de ces jours il tomba plus de 0.5 millim. de pluie. La normale est de 17 jours de pluie, dont 12 avec plus d'un demi-millimètre. Dans trois jours il neigea, et un jour il tomba de la grêle.

La hauteur barométrique oscilla entre 776.9 et 742.1 millimètres; la moyenne fut de 761.6, donc plus haute que la normale, 759.6.

Dix jours du mois furent trop froids; cependant la température moyenne du mois, 3^o.8, fut plus haute que la moyenne normale, 2^o.9. Le maximum de température fut dans ce mois de 14^o.5 et le minimum, —7^o.2. Pendant huit jours, la température fut au-dessous de zéro, mais elle ne resta toute la journée au-dessous de ce point que pendant 2 jours.

Le mois fut en général trop humide; l'humidité relative moyenne s'éleva à 88 %, tandis que le chiffre normal est de 86,2 %.

Le mois de Février s'est distingué par un grand nombre des calmes, alternés par un vent fort. La direction du vent varia surtout entre le SSE et l'WNW; le vent le plus fréquent fut celui du SW. Jusqu'au 12 Février, l'aire de haute pression se maintint au sud de l'Europe, en se déplaçant très peu, et plusieurs dépressions, se déplaçant le long de la côte de l'Ecosse et sur la Scandinavie, se succédèrent.

Hiervan was het gevolg, dat in dien tijd hoofdzakelijk ZW-wind heerschte, die de temperatuur deed stijgen. Ons land behoorde op 6 en 7 Februari tot de streek, waarin het sterkste verval in drukking gevonden werd, zoodat de ZW-wind tot storm aanwakkerde. De gemiddelde drukking was toen 45 K.G. en door den windkrachtmeter werden stooten van 70 K.G. op den M³ aangegeven.

Den 10^{den} Februari woei andermaal een krachtige wind uit het ZW., tengevolge van de secundaire depressie, die zich in Ierland had gevormd. 's Avonds verminderde de kracht om in den nacht van den 11^{den} weer sterk toe te nemen, tengevolge van twee opvolgende depressies, van welke de laatste zich door het noorden van Schotland en het zuiden van Zweden verplaatsende, een groot verval in drukking in onze streken veroorzaakte. Bij dezen storm was de gemiddelde windkracht 50 K.G. en werden stooten tusschen 80 en 90 K.G. aangeleekend. Na den 15^{den} tot den 23^{den} Februari behoorde Nederland bijna oaalgebroken tot het gebied van hooge drukking, gepaard gaande met windstiften en zeer zwakken oostelijken wind. Hierdoor daalde de temperatuur en kregen wij de vermelde vorstdagen.

Van den 24^{den} af kwam het weder in ons land bij afwisseling onder den invloed van een gebied van lage of van hooge drukking; vandaar dat het zoo veranderlijk was. Te Utrecht werd éénmaal onweer gehoord en 2 maal weerlicht gezien, en ook van andere plaatsen werden onweersberichten ontvangen. Op het Instituut werden eens een bijzon, tweemaal een kring om de zon, en éénmaal om de maan waargenomen.

MAART.

Gedurende de eerste dagen van Maart werd het weder beheerscht door een gebied van hooge drukking, dat zich boven Zuid-Duitschland en Zwitserland bevond. Den 4^{den} Maart trad verandering in, doordat zich eene depressie bij de Hebriden vertoonde, die zich meer en meer in ZO-richting uitspreidde. Van deze scheidden zich gedeeltelijk depressies af, die zich over Nederland verplaatsten en den 7^{den} en den 9^{den} respectievelijk krachtigen WZW- en ZZW-wind veroorzaakten. Een lang-

Il en résulta que le vent souffla surtout du SW, ce qui fit monter la température. Notre pays faisait partie, le 6 et le 7 Février, de l'espace où se trouvait la plus rapide diminution de pression, de sorte que le vent du SW y dégénéra en tempête. La pression moyenne fut alors de 45 kilogr., et l'anémographe indiqua des coups de vent de 70 kilogrammes sur un M³.

Le 10 Février, il souffla de nouveau un vent fort du SW, résultant de la dépression secondaire qui s'était formée en Irlande. Le soir, le vent diminua en force, mais reprit avec plus de violence dans la nuit du 11, par suite de deux dépressions consécutives, dont la dernière, se déplaçant par le nord de l'Ecosse et le sud de la Suède, produisit un fort gradient dans notre pays. Dans cette tempête, la force moyenne du vent fut de 50 kilogr., et des coups de vent de 80 à 90 kilogr. furent notés. Après le 15 et jusqu'au 23 Février, les Pays-Bas se trouvèrent presque sans interruption sous une aire de haute pression, accompagnée de calmes et de vent d'est très faible. Cela fit baisser la température, et nous eûmes les jours de gel dont nous avons parlé.

A partir du 23, le temps dans notre pays fut alternativement sous l'influence d'une aire de basse pression et d'une aire de haute pression, ce qui explique la variabilité du temps. A Utrecht, on entendit tonner une fois, et on vit deux fois des éclairs; on y reçut aussi d'autres endroits des observations d'orage. A l'Institut, on observa une fois une parhélie, deux fois un halo autour du soleil et une fois autour de la lune.

MARS.

Pendant les premiers de ce mois, le temps fut dominé par une aire de haute pression qui s'étendait sur le sud de l'Allemagne et la Suisse. Le 4 mars, le temps changea, parce qu'il se présenta une dépression près des Hébrides, qui s'étendit de plus en plus vers le SE. Des dépressions secondaires, qui s'en détachèrent et se portèrent vers les Pays-Bas, y occasionnèrent, le 7 et le 9, un vent fort, venant de l'WSW et du SSW. Une dépression de forme oblongue, qui se forma le

werpig depressie had zich den 13^{den} boven de Noordzee gevormd, en gaf in ons land aanleiding tot een krachtigen ZW-wind. De sterkste steet van 53 K.G. kwam voor op genoemden datum om 10.45 bij een gemiddelde drukking van 33 K.G. Na den 17^{den} was het weder onder den invloed van een gebied van hooge drukking, dat, zich bij de Golf van Biscaye gevormd hebbende, zich in NO-richting verplaatste en uitbreidde. Hieraan hebben wij het mooie weder der laatste dagen van Maart, met windstille of met zeer zwakken wind te danken. Verder heerschten er vooral winden uit het ZZW. en WZW.

De eerste dagen brachten eene groote hoeveelheid regen, terwijl de laatste zeer droog waren, zoodat het totale bedrag van den neerslag 44.9 mm. niet veel verschilde van het normale 44.5 mm. Het aantal dagen met neerslag was 12 (normaal 17), en hierbij zijn nog twee dagen, waarbij de neerslag minder is dan 0.5 mm.

De gemiddelde bewolking is 4.4 (normaal 5.8) en de maand leverde dan ook 7 (normaal 3.6) heldere en slechts 3 (normaal 6) bewolkte dagen op. Op 3 dagen kwam mist voor.

De vochtigheid was slechts 80.6%, tegen een normaal bedrag van 85%, wat de verdamping zeer bevorderde; deze bedroeg 88.2 mm. bij een normale hoeveelheid van 47.5 mm.

De barometerstand wisselde af tusschen 772.8 en 741.0 mm.; gemiddeld was hij 760.5 mm., (terwijl het normaal gemiddelde 758.9 mm. bedraagt.

De gemiddelde temperatuur is normaal in Maart, slechts 4^o.9, terwijl zij in de afgelopen maand 7^o.6 bedraagt. De laagste temperatuur —0^o.5 kwam voor op den 19^{den} om 6 uur in den voormiddag, en de hoogste 18^o.8 C. op den 31^{sten} om 2 uur in den namiddag; slechts 1 dag was de minimum-temperatuur onder nul.

Te Utrecht werden in Maart twee kringen om de zon en drie kranen om de maan gezien. In den nacht van den 30^{sten} op den 31^{sten} werd een prachtig noorderlicht, heter gezegd poollicht, waargenomen, waarentrent op het instituut ook berichten uit Oosterbeek, Haarlem, Wijnbrissersdeele en Kuilenburg werden ontvangen. Dit poollicht werd ook in België gezien.

In den avond van den 4^{ten} Maart tusschen 8.30 en 10 uur onweerde het in de provincie Noord-Holland.

13 sur la mer du Nord, fut la cause du vent fort du SW qui souffla dans notre pays. Sa force moyenne fut de 33 kilogr., et l'on nota un coup de vent de 53 kilogr. à cette date. Après le 17, le temps fut sous l'influence d'une aire de haute pression qui, s'étant formée près du golfe de Biscaye, s'étendit en se déplaçant vers le NE. C'est à cette dernière que nous devons le beau temps des derniers jours de Mars, sans vent ou avec un vent très faible. Les vents régnants furent surtout ceux du SSW et de l'WSW.

Les premiers jours donnaient une grande quantité de pluie, tandis que les derniers jours du mois furent très secs, de sorte que la quantité totale d'eau, 44.9 millim., fut presque égale à la normale, 44.5 millim. Le nombre des jours de pluie fut de 12, (normale 17), et dans ce nombre il y en eut 2, où la quantité de pluie tombée fut moindre de 0.5 millim.

La nébulosité moyenne fut de 4.4, (normale 5.8), aussi le mois donna-t-il 7 jours serenus, (normale 3.6), et seulement 3 jours couverts, (normale 6). Dans trois jours on observa du brouillard.

L'humidité relative ne fut que de 80.6 %, contre une normale de 85 %, ce qui favorisa beaucoup l'évaporation. Celle-ci s'éleva à 88.2 millim., contre une normale de 47.5 millim.

La colonne barométrique oscilla entre 772.8 et 741.0 millim.; sa moyenne fut de 760.5, tandis que la moyenne normale est de 758.9 millim.

La moyenne normale de la température pour le mois de Mars n'est que de 4^o.9, tandis que ce mois-ci donna une moyenne de 7^o.6. La température la plus basse, —0^o.5, fut observée le 19, à 6 heures du matin; la plus haute, 18^o.8, le 31, à 2 heures de l'après-midi. Le thermomètre ne descendit qu'un jour au-dessous de zéro.

A Utrecht, on vit, dans ce mois, deux fois un halo autour du soleil et trois fois une couronne autour de la lune. Dans la nuit du 30 au 31, on observa une magnifique aurore boréale, à propos de laquelle l'institut reçut des communications d'Oosterbeek, de Harlem, de Wymbrissersdeele et de Kuilenburg. Cette aurore boréale fut aussi observée en Belgique.

Dans la soirée du 4 Mars, entre 8 heures et dix heures, il y eut un orage dans la province de la Hollande Septentrionale.

APRIL.

In het begin van April stond het weder onder den invloed van een gebied van hooge drukking en was de luchtdrukverdeling van Europa vrij regelmatig, maar dit gebied trok zich na den 9^{den} langzaam in Noord-oostelijke richting terug en er vormden zich min of meer belangrijke depressies ten westen van Groot-Britanje, terwijl de isolaren een onregelmatigen vorm vertoonden.

Dientengevolge hadden wij buitig weder, dikwijls gepaard met onweder. De geheele hoeveelheid neerslag bedraagt 57.3 mm., dus belangrijk meer dan de normale hoeveelheid 37.9 mm. Ook de verdamping 114.7 mm. was grooter dan normaal 89.5 mm. De gemiddelde relatieve vochtigheid bedroeg 76 % tegen normaal 61 %. Deze schijnbare tegenstrijdigheden worden verklaard door het feit, dat de eerste helft van April buitengewoon droog, daarentegen de laatste helft zeer vochtig was.

De gemiddelde barometerstand was 758.7 mm. (normaal 759.7), hij wisselde af tusschen 765.8 en 750.7. De temperatuur overtrof het normaal gemiddelde 9^{de} belangrijk, gemiddeld was zij 12^{de} 35.

De hoogste temperatuur 22.7 kwam voor op den 8^{den} April om 2 uur nam. en de laagste 4.1 op den 3^{den} om 3 uur en op den 13^{den} om 6 uur in den morgen.

De gemiddelde bewolking 5.2 wijkt bijna niet af van het normale 5.4.

De maand leverde 3 bewolkte en slechts 2 heldere dagen op.

De windkracht was zeer gering, de sterkste stoot van 32 K.G. kwam voor op den 27^{den} om 10^{de} uur. De heerschende windrichtingen waren voornamelijk NNO. en ONO.

De afgekoopen maand was rijk aan onweer, doch meestal zeer lokaal. Utrecht telt dan ook slechts 3 onweersdagen, terwijl van onweer op 14 dagen in deze maand berichten ontvaangen werden. Het aantal treffelrichen is, de tijd van het jaar in aanmerking genomen, aanzienlijk.

Te Utrecht werd den 26^{den} een kring om de zon en den 14^{den} een kring om de maan gezien.

AVRIL.

Au commencement du mois, le temps fut sous l'influence d'une aïre de haute pression, et la pression atmosphérique était assez uniforme sur l'Europe, mais, après le 9, cette aïre de haute pression se dirigea lentement vers le nord-est, et des dépressions plus ou moins grandes se formèrent à l'ouest de la Grande-Bretagne, tandis que les isolares présentèrent une forme irrégulière. Il en résulta des gibouées, souvent accompagnées d'orage.

La quantité de pluie totale fut de 57.3 millim., donc bien plus grande que la quantité normale, qui est de 37.9 millim. L'évaporation. 114.7 millim., fut aussi plus considérable que la normale, 89.5 millim. L'humidité relative moyenne s'éleva à 76 % contre une normale de 61 %. Ces contradictions apparentes s'expliquent, lorsqu'on se dit que la première moitié d'Avril fut très sèche, et que la seconde fut très humide.

La hauteur moyenne du baromètre, 758.7 millim., (normale 759.7), oscilla entre 765.8 et 750.7 millim. La température fut beaucoup plus élevée que la normale, 9^{de} 1; elle fut en moyenne de 12^{de} 35.

La plus haute température, 22.7, fut observée le 8 Avril, à 2 heures de l'après-midi, et la plus basse, 4.1, le 3, à 3 heures, et le 13, à 6 heures du matin.

La nébulosité moyenne, 5.2, diffère peu de la normale, 5.4.

Il y eut dans ce mois trois jours couverts et seulement deux jours seréins.

La force du vent fut très faible, le coup le plus fort, 32 kilogr., fut observé le 27, à 10 %, heures. La direction des vents fut surtout NNE et ENE.

Le mois fut riche en orages, bien qu'ils fussent ordinairement de nature très locale. Utrecht ne compte que 4 jours d'orage, bien que l'Institut ait reçu des communications sur 14 jours de ce mois. Le nombre de fois que la foudre est tombée est très considérable pour cette époque de l'année.

Le 26. on observa à Utrecht un halo autour du soleil et, le 14, un halo autour de la lune.

MEI.

De maand Mei was guur en koud. De temperatuur, die normaal $13^{\circ}6$ C. moest bedragen, was slechts $12^{\circ}5$ C., en deze verhouding wordt nog ongunstiger, wanneer wij bij de berekening 15, 16 en 17 Mei uitzonderen, toen zij ver boven de normale was; dan vinden wij voor de gemiddelde temperatuur $11^{\circ}5$ C. Zij bereikte haar maximum $27^{\circ}1$ op den 17^{den} om 11 $\frac{1}{4}$ uur voorm. en op den 27^{den} daalde zij om 3 $\frac{1}{4}$ uur voorm. tot $4^{\circ}0$ C.

Ook de wind droeg, hoewel zijne kracht zeer gering was, tengevolge van de streek, waaruit hij woei, er veel toe bij om het weder in Mei minder aangenaam te maken. Slechts den 4^{den} kwam een windstoot van 30 K.G. voor, terwijl de gemiddelde kracht 13 K.G. bedroeg. Deze wind werd veroorzaakt door een depressie, die zich van de noordelijke Noordzee naar het zuiden van Zweden verplaatste. Meestal werd NNW-wind aangetoekend.

De bewolking 5.8 overtrof het normale bedrag 5.2, terwijl de maand 4 heldere (normaal 3.9) en 4 bewolkte dagen (normaal 2.6) opleverde. De verdamping was tengevolge van de bovengenoemde warme dagen groot; zij bedroeg 131.5 m.M., terwijl het veeljarig gemiddelde slechts 123.8 bedraagt. De relatieve vochtigheid was 74%, normaal is zij 58%. De hoeveelheid regen was gering; zij bedroeg 34.4 m.M., waarvan nog 12.5 m.M. op den 13^{den} viel. De normale hoeveelheid regen voor deze maand is 49.4 m.M. De afgekoopen maand gaf 14 dagen met neerslag en op 10 dagen viel meer dan 0.5 m.M.; normaal zijn deze getallen respectievelijk 16 en 11. Op 1 dag werd hagel vernield.

Oowoe was van plaatselijk aard en slechts van 11 dagen werden berichten ontvangen. Halo's werden veelvuldig waargenomen, terwijl die van 16 Mei over een groot gedeelte van ons land werd gezien en een bijzondere uitgebreidheid had. De temperatuur daalde in den avond van den 17^{den} zeer sterk. Op den 28^{den} werd te Utrecht om 5 $\frac{1}{4}$ uur nam. eene zeer sterke regenboog gezien, terwijl het in de omstreken van Soest hard regende. De barometer varieerde tusschen 767.1 en 747.6, gemiddeld was hij 758.6, dus lager dan de normale stand 760.1.

MAI.

Le mois de Mai fut rude et froid. La température, dont la normale est de $13^{\circ}6$, ne fut que de $12^{\circ}5$; et cette proportion devient encore plus défavorable, quand, dans le calcul, nous ne tenons pas compte des 15, 16 et 17 Mai, où la température fut de beaucoup au dessus de la normale, car nous trouvons alors $11^{\circ}5$ comme température moyenne. Le maximum, $27^{\circ}1$, fut atteint le 17, à 11 $\frac{1}{4}$ heures du matin, et le minimum, 4° , fut observé le 27, à 3 $\frac{1}{4}$ heures du matin. Quoique la force du vent fut très faible, il contribua aussi beaucoup, par le côté d'où il soufflait, à rendre le temps agréable. Le 4 seulement, on nota un coup de vent de 30 kilogr., tandis que le vent avait alors une force moyenne de 13 kilogram. Ce vent fut causé par une dépression qui se déplaça de la partie septentrionale de la mer du Nord vers le sud de la Suède. Le vent souffla ordinairement du NNE.

La nébulosité, 5.8, fut plus grande que la normale, 5.2, tandis que le mois eut 4 jours sereins (normale 3.9) et 4 jours couverts, (normale 2.6). L'évaporation fut grande, comme conséquence des jours chauds dont il a été parlé ci-dessus; elle s'éleva à 131.5 millim., tandis que la moyenne de nombreuses années n'est que de 123.8. L'humidité relative fut de 74%; la normale est de 58%. La quantité de pluie fut faible; il n'en tomba que 34.4 millim., dont 12.5 furent recueillis le 13. La quantité normale de pluie pour ce mois est de 49.4 millim. Le mois de Mai a compté 14 jours de pluie, dont 10 avec plus de 0.5 millim.; la normale est respectivement de 16 et de 11 jours. Une communication à l'Institut mentionne de la grêle dans un jour.

Les orages furent de nature locale, et l'on ne reçut des communications que pour 11 jours. Des halos furent souvent observés; celui du 16 Mai fut visible dans une grande partie de notre pays; il était d'une étendue remarquable. La température baissa très fortement dans la soirée du 17. A Utrecht, on observa le 28, à 5 $\frac{1}{4}$ heures de l'après-midi, un très bel arc-en-ciel, tandis qu'il pleuvait très fort aux environs de Soest. La hauteur barométrique varia entre 767.1 et 747.6, et fut en moyenne de 758.6, donc plus basse que la moyenne normale, 760.1.

JUNI.

De gemiddelde barometerstand kwam in deze maand met de normale waarde 760.8 overeen, en zij wisselde af tusschen 771.7 en 740.8 m.M. Gedurende de maand was de verdeling der luchtdrukking over Europa vrij gelijkmatig. De sterkste windstoot kwam voor op den 2^{den} om 3½ uur nam., en bedroeg 26 K.G. Op den 4^{den} Juni bestond het gebied van hooge drukking uit eene strook, die zich van het NNW. naar het ZZO. over midden-Europa uitstrekte; de depressies bevonden zich boven Ierland en bij Finland. De eerste verplaatste zich snel over ons land naar het noorden van Duitschland, en veroorzaakte hier op verschillende plaatsen onweer. Den 9^{den} Juni vereenigden zich beide depressies bij de Golf van Riga, waar zij bij geringe verplaatsing het overige deel der maand hebben stand gehouden. De hooge drukkingen werden dan gevonden ten westen van Engeland en deuitengevolge hadden wij noordenwind, doch verschillende depressies volgden elkander op, ten NW. van Schotland gaande en zich somtijds tot boven de Noordzee uitstrekkende, zoodat wij onder hun invloed dan de westelijke winden (WZW., W. en WNW.) kregen. Deze depressies veroorzaakten verder neerslag en bewolkten hemel.

De hoeveelheid neerslag bedroeg 70.7 m.M., tegen gemiddeld 54.8; deze viel op 15 dagen, overeenkomende met het normale getal, maar op 12 — en volgens het gemiddelde bedraagt dit slechts 10 dagen — viel meer dan 0.5 m.M.

De verdamping was tengevolge der bewolking en der lage temperatuur gering; zij bedroeg slechts 110.3 m.M., tegen gemiddeld 136.1 m.M.; bovendien komt nog 30.1 m.M. op de laatste 4 dagen. De relatieve vochtigheid was sterk. 82% tegen gemiddeld 61%.

De gemiddelde bewolking was 6.2, tegen normaal 5.5, en de maand leverde 9 bewolkte (normaal 3.5) en slechts 3 heldere (normaal 3.5) dagen op, nml. de drie laatste dagen der maand, toen wij onder den invloed van een gebied van hooge drukking waren gekomen. Reeds den 22^{den} was dit het geval maar den 23^{den} en 24^{den} trok het zich in zuidelijke richting terug. Den 25^{den} bevond het zich weder boven Noord-Frankrijk, maar de depressie bij Finland beheerschte in Nederland nog het weder. Na den 26^{den} had het gebied van hooge drukking de

JUNI.

La hauteur barométrique moyenne dans ce mois fut d'accord avec la normale, 760.8; elle oscilla entre 771.7 et 740.8. Pendant ce mois, la pression atmosphérique sur l'Europe fut assez uniforme. Le coup de vent le plus fort se fit sentir le 2, à 3½ heures de l'après-midi; il fut de 26 kilogr. Le 4 Juin, l'aire de haute pression formait une bande qui s'étendait du NNW au SSE sur l'Europe centrale; les dépressions se trouvaient au dessus de l'Irlande et près de la Finlande. La première se déplaça rapidement par dessus notre pays vers le nord de l'Allemagne, et occasionna de l'orage en plusieurs endroits des Pays-Bas. Le 9 Juin, ces deux dépressions se réunirent près du golfe de Riga, où elles se maintinrent sans déplacement notable pendant le reste du mois. Les hautes pressions se trouvant alors à l'ouest de l'Angleterre, amenèrent un vent du nord, mais plusieurs dépressions se succédant, se dirigeant vers le NW de l'Ecosse, et s'étendant parfois jusqu'au dessus de la mer du Nord, firent naître des vents d'ouest (WSW, W et WNW); ces dépressions amenèrent de la pluie et un ciel couvert.

La quantité de pluie fut de 70.7 millim., contre 54.8 en moyenne; cette pluie tomba pendant 15 jours, nombre conforme à la moyenne, mais dans 12 jours — la moyenne donne 10 jours — il en tomba plus de 0.5 millimètre.

L'évaporation fut faible, grâce à la nébulosité et à la basse température; elle n'atteignit que 110.3 millim., contre une moyenne de 136.1, et, sur cette quantité, 30.1 millim. reviennent encore aux quatre derniers jours du mois. L'humidité relative fut forte; elle s'éleva à 82%, tandis que la moyenne n'est que de 61%.

La nébulosité moyenne fut de 6.2, contre une normale de 5.5; ce mois eut 9 jours couverts, normale 3.5, et seulement 3 jours serrens, normale 3.5; ce sont les derniers jours du mois, lorsque nous nous trouvions sous une aire de haute pression. Le 22, nous nous trouvions déjà sous son influence, mais le 23 et le 24 elle se retira vers le sud. Le 26, elle se trouvait de nouveau sur le nord de la France, mais la dépression existante près de la Finlande dominait encore le temps aux Pays-Bas. Après le 26, l'aire de haute pression devint dominante, et

overhand verkregen, en kwamen de 4 warme dagen. Den 29^{sten} werd het maximum in temperatuur bereikt om 9 uur voorn., namelijk 25° 8 C. De laagste temperatuur in de maand was 5° 4 C., en viel op den 1^{sten}, om 3½ uur voorn. De gemiddelde temperatuur der maand was 15° 2 C., tegen normaal 16° 9, dus was de maand veel te koud. De gemiddelde temperatuur der 26 eerste dagen was slechts 14° 5 C. en die der 4 laatste 20° 3 C.

Op den 24^{sten} werd te Utrecht een kring om de zon gezien.

JULI.

Het gebied van hooge drukking, dat de laatste dagen van Juni het weder beheerschte, hield, wel is waar, nog in het begin van Juli stand, maar nam toch spoedig in betekenis af en verplaatste zich in oostelijke richting, totdat den 7^{den} een depressie, die ten westen van Groot-Brittanje verschenen was, zijn invloed op het weder deed gelden. Over het algemeen was de luchtdrukking in deze maand onregelmatig over Europa verspreid, maar de verschillen waren gering, zoodat de wind zeer verschillend van richting en zwak was; overigens was de wind hoofdzakelijk ZZW. en WZW. De sterkste windstoot van 35 K.G. kwam voor op 11 Juli te 12.45 nam., terwijl de gemiddelde drukking toen 12 K.G. bedroeg. Deze wind was een gevolg van een depressie, die zich boven de zuidelijke Noordzee bevond en zich over ons land bewoog.

Om 11 uur op dezen dag daalde de barometer tot 739.0 mm.; een stand die van 1849—1893 in Juli niet is voorgekomen; in 1879 op 21 Juli werd om 8 uur 's morgens 740.6 mm. afgelezen. De hoogste stand van den barometer in de afgelopen maand valt op den 1^{sten} en was 769.8 mm., terwijl de gemiddelde stand slechts 758.8 bedroeg en de normale 760.7 mm. is.

In het gebied van lage drukking, waaronder na 7 Juli Nederland zich bevond, vormden zich herhaaldelijk secundaire depressies, die, over ons land trekkende, veelvuldig onweder en regen brachten. Te Utrecht werd op 13 dagen onweder of weerlicht waargenomen, maar wat geheel Nederland betreft, waren slechts 4, 5, 9, 26, 27, 28 en 31 Juli zonder

c'est à elle que nous devons les 4 jours chauds. Le maximum de température, 25° 8, fut atteint le 29, à 9 heures du matin; la température la plus basse du mois, 5° 4, fut notée le 1^{er}, à 3½ heures du matin. La moyenne de la température fut de 15° 2, contre une normale de 16° 9; ce mois fut donc de beaucoup trop froid. La température moyenne des 26 premiers jours du mois ne s'éleva qu'à 14° 5; celle des 4 derniers jours s'éleva à 20° 3.

Le 24, on observa à Utrecht un halo autour du soleil.

JUILLET

L'aire de haute pression qui domina le temps dans les derniers jours de Juin, se maintint encore au commencement du mois de Juillet, mais diminua bientôt d'importance et se déplaça vers l'est, jusqu'à ce que, le 7, une dépression qui s'était formée à l'ouest de la Grande-Bretagne fit sentir son influence sur le temps. Dans ce mois, la pression atmosphérique était très irrégulièrement répartie au-dessus de l'Europe, mais les différences étant minimes, le vent fut faible et souffla de directions très diverses. Le vent souffla principalement du SW et de l'WSW. Le coup de vent le plus fort, (35 kilogr.), se fit sentir le 11 Juillet, à 12.45 de l'après-midi, tandis que la pression moyenne fut alors de 12 kilogr. Ce vent était dû à une dépression qui se trouvait au-dessus de la partie méridionale de la mer du Nord et qui traversa notre pays.

Ce même jour, à 11 heures du matin, le baromètre baissa jusqu'à 739 millim., ce qui ne s'était pas présenté au mois de Juillet depuis 1849 jusqu'à 1893: le 21 Juillet 1879, à 8 heures du matin, on avait noté 740.6 millim. Le niveau le plus élevé du baromètre dans ce mois fut observé le 1^{er}; il était de 769.8 millim. Le niveau moyen fut seulement de 758.8, tandis que la normale est de 760.7 millim.

Il se forma à plusieurs reprises, dans l'aire de basses pressions qui eût après le 7 Juillet sur les Pays-Bas, des dépressions secondaires, qui, en passant sur notre pays, amenèrent de fréquents orages et beaucoup de pluie. A Utrecht, on eut 13 jours d'orage ou dans lesquels on vit des éclairs: dans les Pays-Bas, le 4, 5, 9, 26, 27, 28 et 31 Juillet

electrische verschijnselen. Vooral de onweders van 2, 7, 14, 23 en 25 Juli waren zeer uitgebreid en van hevigen aard; het aantal trefferbichten op het Instituut ontvangen is dan ook in de afgeleopen maand bijzonder groot.

De hoeveelheid neerslag in Juli, 142.8 mM. overtreft ver de normale van 75.4 mM. Deze hoeveelheid viel op 21 dagen (normaal 17) en slechts op 4 dagen viel minder dan 0.5 mM. In verband hiermede was dan ook de relatieve vochtigheid groot, namelijk 83 % tegen 64 % normaal en was de verdamping gering. Reze bedroeg 117.9 mM. tegen gemiddeld 130.2 mM.

In de maand Juli mag volgens het veeljarig gemiddelde niet meer dan 2.1 bewolkte dagen voorkomen, maar zij gaf er 8, terwijl zij overeenkomstig met het normale 3 heldere dagen opleverde. De gemiddelde bewolking is 6.0, zoodat het veeljarige gemiddelde niet 0.6 overschreden wordt.

De hoogste temperatuur 30° 7 C. kwam voor op Juli 'smiddags om 2 uur, en de laagste 11° 5 C. op den 13^{den} te 4 uur en op den 19^{den} Juli te 4 uur 's morgens. De gemiddelde temperatuur was 18° 2 C., wat bijna niet van de normale waarde 18° 3 C. verschilt.

Te Utrecht werd ons de zon een kring en om de maan een kranen gezien.

AUGUSTUS.

Kwam Juli, wat aangaat zijn verplichtingen betreffende het weder, te kort, Augustus maakte het niet veel beter. Zij leverde ons maar één dag waarop de temperatuur boven de 25° C. steeg, terwijl wij recht zouden hebben op 4.5 dag. De gemiddelde maandelijksche temperatuur bedroeg 16° 2 C. dat is 1° 8 minder dan de normale waarde. De minimum-temperatuur was meermalen 10° en het maximum 26° 9 werd op 6 Augustus om 2 uur nam. bereikt.

De gemiddelde bewolking was 6.4 tegen normaal 5.4 terwijl slechts 2 heldere dagen, maar 11 bewolkte voorkwamen, dus alweer 9 meer dan wij mochten verwachten. Met den regen is het niet beter gesteld.

furent les seuls jours où l'on n'observa pas de phénomènes électriques. Les orages du 2, 7, 14, 23 et 25 Juillet furent très étendus et très violents, aussi le nombre des communications reçues à l'Institut sur les coups de foudre, a été très grand dans ce mois.

La quantité de pluie tombée en Juillet, 142.8 millim., dépasse de beaucoup la normale, 75.4. Cette quantité tomba pendant 21 jours, normale 17, et il n'y eut que 4 jours où il en tomba moins de 0.5 millim. C'est pour cette raison que l'humidité relative fut si grande; elle s'éleva à 83 % contre une normale de 64 %, et que l'évaporation fut si faible: 117.9 millim., normale 130.2.

D'après la moyenne d'un grand nombre d'années, le mois de Juillet ne doit avoir que 2.1 jours couverts; cette année il en eut 8, mais le nombre de jours sereins, 3, est conforme à la normale. La nébulosité moyenne, 6, fut de 0.6 plus grande que la moyenne normale.

La plus haute température, 30° 7 se présenta le 2 Juillet, à 2 heures de l'après-midi, et la plus basse, 11° 5, le 13, à 4 heures et le 19, à 1 heure du matin. La température moyenne fut de 18° 2, et ne diffère guère de la normale 18° 3.

On vit à Utrecht un halo autour du soleil et une couronne autour de la lune.

AOUT.

Si le mois de Juillet resta au dessous de ce qu'on en attendait quant au temps, celui d'Août ne fut guère meilleur. Il n'eut qu'un jour où la température s'éleva au-dessus de 25°, tandis que nous aurions pu compter sur 4.5 jours. La température moyenne fut de 16° 2, de 1° 8 inférieure à la normale. Le minimum de température fut souvent de 10°, le maximum, 26° 9, fut atteint le 6 Août, à 2 heures de l'après-midi.

La nébulosité moyenne fut de 6.4, la normale est de 5.4, 2 jours sereins seulement et 11 jours couverts, ainsi 9 de plus qu'on ne pouvait s'y attendre. La pluie ne donna pas des résultats plus favorables; la

de geheele hoeveelheid neerslag bedraagt te Utrecht 128.1 mM., terwijl gemiddeld in Augustus 82.1 mM. valt. De hoeveelheid viel op 23 dagen, waaronder er slechts 8 zijn, waarop minder dan 0.5 mM. viel.

De verdamping was deze maand dan ook weer betrekkelijk gering, slechts 81.5 mM. (gemiddeld 117.5 mM.) en de vochtigheid groot 87% (gemiddeld 67%). Slechts wat den wind betreft, heeft Augustus het goed gemaakt; was er wind, dan was deze hoofdzakelijk ZZW. Slechts op 6 Augustus om 2 uur was te Utrecht tijdens een onweder een windstoot van 33 K.G. waargenomen, de gemiddelde windkracht bedroeg toen ook niet meer dan 5 K.G. Deze geringe hoeveelheid wind was toe te schrijven aan de gelijkmatige verdeling der luchtdrukking over Europa, zoodat geen groote verschillen voorkwamen. Het weder werd in Augustus, alleen de laatste dagen uitgezonderd, beheerscht door depressies, die zich bij Groot-Brittannië vertoonden en zich in oostelijke of noord-oostelijke richting voortbewogen. Deze veroorzaakten hier bewolkten hemel en regen, maar het buiige weder hadden wij hoofdzakelijk te danken aan secundaire depressies, want, al waren de verschillen gering, toch was de verdeling der luchtdrukking over Europa onregelmatig. De barometerstand te Utrecht varieerde tusschen 768.0 en 751.2 mM. en het gemiddelde bedroeg 759.0 mM.

Onweder kwam hoofdzakelijk voor op 2, 6, 10 en 27 Augustus. Te Utrecht viel geen hagel, maar het is bekend, dat op 6 Augustus het westelijk deel van Zuid-Holland, en op 27 Augustus de omgeving van Gendringen door hagel geteisterd werden.

SEPTEMBER.

De gemiddelde barometerstand 762.9 mM. in de maand September was 2.2 mM. hooger dan de normale. Hij wisselde af tusschen 772.7 mM. en 751.7 mM. Gedurende het grootste gedeelte van de afgekoopen maand stond de barometer in westelijk Europa hoog en was het verval in drukking gering. Dit laatste veroorzaakte zwakken wind, plaatselijk zeer afwisselend in richting. Windstilten kwamen veelvuldig voor. De lage

quantité qui tomba à Utrecht dans ce mois fut de 128.1 millim., tandis que la moyenne normale est de 82.1. Cette quantité tomba dans 23 jours, parmi lesquels il n'y en eut que 8 où il tomba moins de 0.5 millim.

L'évaporation fut de nouveau relativement faible, 81.5 millim., contre une normale de 117.5, et l'humidité grande, 87%, contre une moyenne de 67%. Le vent seul ne donna pas lieu de se plaindre et, lorsqu'il souffla, ce fut ordinairement un vent du SSW. Le 6 Août seulement, à 2 heures, on nota à Utrecht, pendant un orage, un coup de vent de 33 kilogr., tandis que la force moyenne du vent n'était alors que de 5 kilogr. Cette faible quantité de vent était due à la répartition uniforme de la pression atmosphérique sur l'Europe, de sorte qu'il ne se présentait pas de gradient important. Sauf dans les derniers jours du mois d'Août, le temps fut sous l'influence de dépressions qui se présentèrent près de la Grande-Bretagne et se dirigèrent vers l'est ou le nord-est. Elles amenèrent dans notre pays un ciel couvert et de la pluie; cependant, le temps orageux fut surtout dû à des dépressions secondaires, car, si le gradient était faible, la pression atmosphérique en Europe était pourtant irrégulière. Le niveau barométrique à Utrecht oscilla entre 768 et 751.2 millim., et fut en moyenne de 759 millim.

Des orages furent observés surtout le 2, 6, 10 et 27 Août. Il ne tomba pas de grêle à Utrecht, mais, le 6 Août, la partie occidentale de la province de la Hollande Méridionale et, le 27 Août, les environs de Gendringen furent ravagés par la grêle.

SEPTEMBRE.

Le niveau moyen du baromètre dans le mois de Septembre, 762.9 millim., fut de 2.2 millim. plus haut que la normale. Il varia entre 772.7 et 751.7 millim. Pendant la plus grande partie du mois, le baromètre fut haut dans l'Europe occidentale et le gradient faible. Ce dernier amena un vent faible, de directions très diverses. Il y eut beaucoup de calmes. Les basses pressions se trouvaient à l'est de la

drukkingen werden gevonden ten Oosten van de Oostzee, waardoor in ons land NNO-lijke winden waaiden. Deze koude winden gaven een lage temperatuur; zij bedroeg slechts 13° 2 C. tegen normaal 15° 1 C. De hoogste temperatuur 20° 5 C. kwam voor op den 1^{sten} 's namiddags om 1½ uur en de laagste 6° 0 C. op den 11^{den} 's morgens te 5¼ uur. De lage temperatuur ging vergezeld van eene groote vochtigheid, die 84% (normaal 70%) bedroeg. De bewolking was normaal (5.4), evenals het aantal heldere dagen (4), maar het aantal bewolkte dagen (4) was er één te veel.

Den 6^{den} September bevond zich een depressie boven Finland, die zich over Zweden naar het Skagerrak verplaatste en 8 September over Denemarken naar Midden-Duitschland trok. Deze veroorzaakte in onze streken buitengewoon weder en plotseling onweder. De wind was op die dagen westelijk en op den 7^{den} kwam de sterkste windstoot in deze maand voor om 12.45 namiddag. Zij bedroeg echter slechts 17 K.G. op den N°.

In den nacht van 21 op 22 September trok een depressie, die zich losgemaakt had van het barometrisch minimum boven den zuidelijken ingang van het kanaal over ons land, en veroorzaakte zware slagregens en in Limburg onweder. Den 25^{den} September breidde de depressie bij het kanaal zich uit en trok 's nachts over ons land, begeleid van onweder, vooral in de zuidelijke provincien, en gevolgd door zware regenbuien; te Utrecht viel bijv. op 26 September onstreeks den middag 18.2 mm. Den 27^{den} kwam de depressie boven de zuidelijke Oostzee en den 29^{den} boven Midden-Duitschland, waar zij zich oploste.

De totale neerslaghoogte bedroeg dan ook ten gevolge van het buitengewoon 72.8 mm. tegen normaal 66.0 mm. De verdamping is 69.2 mm., dat is 3 mm. minder dan het gemiddelde bedrag. De neerslag viel op 18 dagen, waaronder 6 dagen, waarbij hij minder dan 0.5 mm. bedroeg.

Te Utrecht werden tweemaal een kraus en eenmaal een kring om de maan gezien.

Baltique, ce qui causa dans notre pays des vents du NNE. Ces vents froids donnaient une basse température; aussi la température moyenne de ce mois ne fut-elle que de 13° 2, tandis que le normale est de 15° 1. La plus haute température, 20° 5, se présenta le 1^{er}, à 1½ heure de l'après-midi; la plus basse, 6°, le 11, à 5¼ heures du matin. Cette basse température fut accompagnée d'une grande humidité, 84 %, contre une normale de 70 %. La nébulosité, 5.4, fut normale, ainsi que le nombre des jours seréins, 4; mais celui des jours couverts, 4, fut d'un jour plus grand que le normale.

Une dépression, qui se trouvait le 6 Septembre au-dessus de la Finlande, se déplaça par dessus la Suède vers le Skager Rack, et passa, le 8, par dessus le Danemark vers l'Allemagne centrale. Cette dépression causa dans nos contrées un temps pluvieux et des orages locaux. Pendant ces jours-là, le vent souffla de l'ouest, et on nota, le 7, à 12.45 de l'après-midi, le coup de vent le plus fort du mois, qui ne fut cependant que de 17 kilogr. sur un mètre carré.

Dans la nuit du 21 au 22 Septembre, une dépression qui s'était détachée du minimum barométrique au-dessus de l'entrée de la Manche, passa sur notre pays. Elle amena de violentes averses et causa de l'orage dans la province du Limbourg. Le 25 Septembre, la dépression près de la Manche s'étendit, passa pendant la nuit sur notre pays, accompagnée d'orage, surtout dans les provinces méridionales, et suivie de fortes averses. Ainsi, il tomba à Utrecht, le 26 Septembre, vers le milieu de la journée, 18.2 millim. de pluie. Le 27 Septembre, la dépression se trouvait au-dessus du sud de la Baltique et, le 29, au-dessus de l'Allemagne centrale, où elle disparut.

La quantité totale de pluie tombée fut, comme conséquence de ce temps pluvieux, de 72.8 millim., donc de nouveau plus grande que le normale, 66 millim. L'évaporation, 69.2 millim., est de 3 millim. au-dessus de la moyenne normale. Cette quantité de pluie est tombée en 18 jours, dans 6 desquels on a recueilli moins de 0.5 millim.

A Utrecht, on observa deux fois une couronne et une fois un halo autour de la lune.

OCTOBER.

De afgelopen maand heeft maar enkele frane dagen opgeleverd, het weder was veeltijds betrokken en mistig. De gemiddelde bewolking was 7.2 (normaal 5.8) en slechts 3 heldere, maar 9 bewolkte dagen kwamen voor. Op 12 dagen was het te Utrecht mistig. De relatieve vochtigheid was dan ook groot gemiddeld 90 %, tegen normaal slechts 76 %. De hoeveelheid regen op 21 dagen gevallen was 69.1 mm., dat is 3.9 mm. minder dan het veerjarig gemiddelde. De barometerstand varieerde tusschen 739.8 en 773.0 mm., gemiddeld was hij gelijk aan een normalen stand 759.0 mm.

In het begin der maand was de luchtdrukking meestal regelmatig over Europa verdeeld, terwijl de verschillen gering waren, de wind was dientengevolge zwak.

Den 14^{ten} werden vrij hooge drukkingen ten westen van Schotland gevonden en veroorzaakten in verband met een depressie, die zich boven de zuidelijke Oostzee bevond, een matigen NNO-wind, waardoor wij in de volgende dagen schraal, guur weder hadden. Op 20 October was boven Frankrijk een depressie aanwezig, die zich noordwaarts verplaatste, zoodat zich den volgende dag een storm-centrum ten westen van ons land boven de zuidelijke Noordzee bevond. Hieraan hadden wij een krachtigen westelijken wind te danken; de gemiddelde drukking was 28 K.G. op de M³ en om 2 uur nam. kwam de sterkste stoot van deze maand voor. De anemometer gaf daarvoor 36 K.G. aan. Den 23^{sten} vorinde zich boven Nederland een gebied van hooge drukking tusschen de boven vermelde depressie, die naar de Finsche golf getrokken was en een andere ten westen van Ierland. Den volgende dag was de kern van deze laatste boven Valentia en zij trok 25 October langs ons land naar de Oostzee, hier te lande krachtige ZW- en W-wind gevende. Op 27 October woei een krachtige W-wind tegevolge van twee centra, gelegen in een strook van lage drukking, die zich uitstrekte van Engeland over Duitschland tot Finland. Het ééne centrum lag boven Ierland, het tweede boven de noordelijke Noordzee. In den loop van den dag smolten zij samen en namen in betekenis af.

OCTOBRE.

Le mois n'eut que quelques beaux jours; le temps fut souvent couvert et brumeux. La nébulosité moyenne fut de 7.2, normale 5.8; il n'y eut que 3 jours serains, mais en revanche il y eut 9 jours couverts. Dans 12 jours, il fit du brouillard à Utrecht. Aussi l'humidité relative fut-elle grande, 90 % en moyenne, contre une normale de 76 % seulement. La quantité de pluie tombée pendant 21 jours fut de 69.1 millim., c'est-à-dire 3.9 millim. de moins que la moyenne d'un grand nombre d'années. Le niveau barométrique oscilla entre 739.8 et 773 millim.; sa moyenne, 759 millim., fut égale à la normale.

Am commencement du mois, la pression atmosphérique était ordinairement répartie régulièrement sur l'Europe, tandis que le gradient était minime, de sorte que le vent fut faible.

Le 14 Octobre, l'aire de hautes pressions se trouvait à l'ouest de l'Ecosse, et occasionna, en rapport avec une dépression qui se trouvait sur le sud de la Baltique, un vent modéré du NNE, qui donna les jours suivants un temps rude et froid. Le 20 Octobre, il se trouvait au-dessus de la France une dépression qui se déplaça vers le nord, de sorte que, le lendemain, un centre de tempête se trouvait à l'ouest de notre pays, au-dessus du sud de la mer du Nord. C'est à cela que nous dûmes un fort vent d'ouest, d'une force moyenne de 28 kilogr. sur un mètre carré. Le coup de vent le plus fort du mois, 36 kilogr., indiqué par l'anémomètre de pression, se présenta à 2 heures de l'après-midi. Le 23 Octobre, il se forma au-dessus des Pays-Bas une aire de hautes pressions, entre la dépression dont nous venons de parler, qui s'était déplacée sur le golfe de Finlande, et une autre, à l'ouest de l'Irlande. Le jour suivant, le centre de celle-ci se trouvait au-dessus de Valentia, et passa, le 25 Octobre, le long de notre pays, vers la Baltique, occasionnant chez nous de forts vents du SW et d'Ouest. Le 27 Octobre, nous eûmes un fort vent d'Ouest, résultant de deux centres qui se trouvaient dans une bande de basses pressions, s'étendant de l'Angleterre par l'Allemagne jusqu'en Finlande. Un de ces centres se trouvait au-dessus de l'Irlande, l'autre au-dessus de la partie septentrionale de la mer du Nord. Dans le courant de la journée, ces deux centres se confondirent et diminuèrent d'importance.

Bij deze stormachtige winden werden op verschillende plaatsen in Nederland lesse donderslagen gehoord.

De gemiddelde temperatuur was $0^{\circ}.7$ C. lager dan de normale waarde $10^{\circ}.4$ C. Haar maximum $17^{\circ}.2$ viel op 8 October om 2 uur nam. en haar minimum op 19 October om $4\frac{1}{2}$ uur voorn.

Te Utrecht werden 4 kruisen om de maan en een kring om de zon gezien.

NOVEMBER.

De gemiddelde barometerhoogte bedroeg 761.9 m.M., dat is 2.6 m.M. hooger dan de normale stand. Zij varieerde tusschen 772.4 en 737.3 m.M. De lage standen kwamen in de eerste, de hooge in de laatste helft der maand voor, want na 17 November werd het weder beheerscht door een gebied van hooge drukking boven Central-Europa. In de tweede week heerschte herhaaldelijk storm en stormachtige wind, voornamelijk n.l. t. Z.W.; den 8^{ten} tengevolge van een intensieve depressie boven de Noordzee, en den 11^{den} veroorzaakt door een onregelmatig depressiegebied, dat zich over Engeland, de Noordzee en Scandinavië uitstreckte. In den nacht van 12 op 13 November trok een krachtig stormcentrum over ons land. De gemiddelde windkracht bedroeg 40 K.G. op den 12, op 12 November om 11 uur nam. werd een stoot van 60 en op 13 November om $1\frac{1}{2}$ uur voorn. een van 71 K.G. aangetekend. Een nieuw minimum bij Schotland veroorzaakte den 14^{den} een stormachtigen Z-wind, waarbij de sterkste stoot om 10 uur nam. voorkwam. Voor dezen werd een kracht van 45 K.G. aangegeven. Den 15^{den} voortdurend zich een intensieve depressie ten NW. van Schotland, verbonden met een secundair minimum boven Engeland en 't Kanaal; een stormachtige wind hier te lande was daarvan het gevolg. De krachtige wind op 8 November was boven de westelijke helft van Nederland van onweder vergezeld.

De hoeveelheid regen bedroeg 68.7 m.M. (normaal 59.4) tegen een verdamping van 26.7 m.M. De gemiddelde betrekkelijke vochtigheid was 90%. De neerslag viel op 16 dagen en op 13 dagen (overeenkomstig

Ces vents tempétueux furent accompagnés dans plusieurs endroits des Pays-Bas de quelques coups de tonnerre.

La température fut en moyenne de $0^{\circ}.7$ au dessous de la normale. $10^{\circ}.4$. Le maximum, $17^{\circ}.2$, se présenta le 8 Octobre, à 2 heures de l'après-midi, et, le minimum, le 19 Octobre, à 4 heures et demie du matin.

On vit à Utrecht quatre couronnes autour de la lune et un halo autour du soleil.

NOVEMBRE.

La hauteur barométrique moyenne, 761.9 millim., fut de 2.6 millim. plus élevée que la normale. Elle varia entre 772.4 et 737.3 millim. Les moindres hauteurs se présentèrent dans la première moitié du mois; les plus hautes, dans la seconde moitié, car, après le 17 Novembre, le temps fut sous l'influence d'une aire de hautes pressions au dessus de l'Europe centrale. Dans la seconde semaine du mois, on eut à plusieurs reprises des tempêtes et un vent violent, surtout du SW; le 8 Novembre, à la suite d'une forte dépression au dessus de la mer du Nord; le 11, comme conséquence d'une aire de dépression irrégulière qui s'étendait au dessus de l'Angleterre, de la mer du Nord et de la Scandinavie. Dans la nuit du 12 au 13 Novembre, un fort centre de tempête passa sur notre pays. La force moyenne du vent fut de 40 Kilogr. par mètre carré; le 12, à 11 heures du soir, on nota un coup de vent de 60 Kilogr., et le 13, à 4.30 heure du matin, un autre, de 71 kilogr. Un nouveau minimum, près de l'Ecosse, arriva, le 14 Novembre, un vent violent du Sud, dont la pression maximum, 45 kilogr., fut notée à 10 heures du soir. Le 15 Novembre, il se présenta une grande dépression au NW de l'Ecosse, qui, réunie avec une dépression secondaire au dessus de l'Angleterre et de la Manche, causa un vent de tempête. Le vent fort du 8 Novembre fut accompagné d'orage dans la partie occidentale des Pays-Bas.

La quantité de pluie tombée s'éleva à 68.7 millim., contre une normale de 59.4 millim. L'évaporation fut de 26.7 millim., l'humidité relative de 90%. La pluie tomba dans 16 jours, dont 13, conformément

met het gemiddelde aantal) meer dan 0.5 mM. De bewolking was gemiddeld 6.9 tegen normaal 6.3 en het aantal bewolkte dagen bedroeg 8, het aantal heldere 2, beide overeenkomstig het normale getal.

De hoogste temperatuur 15° 3 C. viel op 3 November om 2 ure nam. en de laagste —0° 9 op 27 November om 3 uur nam.; gemiddeld bedroeg de temperatuur 6° 9 C., dat is 1° 7 hoger dan de normale; op 3 dagen (25, 26 en 27 November) was de minimum-temperatuur beneden 0°.

Veelvuldig werden optische verschijnselen in den danipkring waargenomen, te Utrecht bijv. 4 kringen om de zon en 4 om de maan, 2 maal een bijzon en 7 maal een krans om de maan. Den 13^{de} werd te Wehl, te Zeist en te St. Jacobi Parochie, den 23^{de} te Aalsum bij Dokkum en den 30^{de} te Haarlem poollicht gezien; op deze dagen werden te Utrecht sterke magnetische storingen opgemerkt.

DECEMBER.

In de maand December weken de meteorologische elementen weinig van hun normale waarde af, alleen de neerslaghoogte en de temperatuur maakten hierop een uitzondering. De laatste bedroeg gemiddeld 42.0 C., dat is 4° 4 C. hoger dan de normale. De hoogste temperatuur, 8° 8 C., kwam voor op 15 December om 4.45 uur voorm. en de laagste —2° 4 C. op 5 en 6 December, resp. om 11 en om 7 uur voorm. De neerslaghoogte was 92.1 mM., terwijl het veeljarig gemiddelde slechts 61.2 mM. bedraagt. Het aantal regendagen was 19, dat is 1 minder dan normaal. Ook sneeuw en hagel droegen het hunne aan den neerslag bij, terwijl op 15 dagen mist voorkwam.

De barometer stond gemiddeld juist op zijn normalen stand, 760.4 mM. Hij wisselde af tusschen 775.2 en 736.4 mM. Het weder werd gedurende het grootste gedeelte van de maand beheerscht door een gebied van hoge drukking; in dien tijd was de wind zwak. Den 15^{de} lag boven de noordelijke Noordzee een depressie met een uitlooper boven

à la normale, donnèrent plus de 0.5 millim. La nébulosité moyenne fut de 6.9, contre une normale de 6.3; le nombre des jours couverts, de 8, et celui des jours sereins, de 2, d'accord avec la normale.

La plus haute température, 15° 3, fut observée le 3 Novembre, à 2 heures de l'après-midi; la plus basse, —0° 9, le 27 Novembre, à 3 heures de l'après-midi; la moyenne de la température donna 6° 9, c'est-à-dire 1° 7 de plus que la normale. Dans trois jours, le 25, le 26 et le 27, le minimum de température fut au dessous de zéro.

Des phénomènes optiques de l'atmosphère furent souvent constatés; à Utrecht, par exemple, on vit 4 halos autour du soleil, 4 autour de la lune, 2 fois une aurore et 7 fois une couronne autour de la lune. Le 13 Novembre, on vit une aurore boréale à Wehl, à Zeist et à St. Anna Parochie; le 23 Novembre, à Aalsum près de Dokkum, et, le 30 Novembre, à Haarlem. Dans ces jours là, on observa à Utrecht de grands troubles magnétiques.

DÉCEMBRE.

Les éléments météorologiques s'écartèrent peu, dans ce mois, de leur normale; la quantité de pluie tombée et la température font cependant exception. Cette dernière, dont la moyenne fut de 4°, se trouva de 4° 4 plus haute que la normale. La température la plus élevée, 8° 8, fut notée le 15 Décembre, à 4.45 heures de l'après-midi, et la plus basse, —2° 4, le 5 et le 6 Décembre, respectivement à 11 et à 7 heures du matin. La pluie donna 92.1 millim., contre une moyenne de nombreuses années de 61.2 millim. seulement. Le nombre des jours de pluie fut de 19, donc 1 de moins que la normale. La neige et la grêle eurent leur part dans la quantité d'eau recueillie. Il fit du brouillard dans 15 jours.

Le niveau moyen du baromètre, 760.4 millim., est précisément égal à la normale. Il oscilla entre 775.2 et 736.4 millim. Pendant la plus grande partie du mois, le temps fut sous l'influence d'une aire de hautes pressions; dans cet intervalle, le vent fut faible. Le 15 Décembre, il se trouvait, au dessus de la partie septentrionale de la mer du Nord, une dé-

NW-Duitschland. Behalve krachtigen wind gaf deze depressie ook onweder in de omstreken van Gouda. Eene ondiepe depressie bewoog van 18—20 December van 't Noorden van Schotland naar Nederland, waar zij zich oploste. Den 22^{den} verscheen een depressie met een kern van 730 mB. en een sterk verval van drukking ten oosten van Schotland, en trok dien dag langs Nederland, hier te lande eerst een storm uit 't ZW. en daarna uit 't W. veroorzakende. De gemiddelde winddrukking te Utrecht was onstreeks 36 K.G. en de sterkste stoot, van 60 K.G., werd om 8 $\frac{1}{2}$ uur nam. waargenomen. Aan de kusten waren de stooten veel sterker, b.v. te Vlissingen 3 $\frac{1}{4}$ uur nam. 111, te Katwijk 6 $\frac{1}{2}$ uur nam. ruim 100 en te Helder onstreeks 7 uur nam. 115 K.G. per M².

Na 28 December trok een depressie, steeds in diepte afnemende, van 't noorden van Schotland, over Noorwegen, het zuiden van Zweden en Denemarken, om op Nieuwjaarsdag boven Duitschland te verdwijnen. Deze depressie gaf vooral boven Friesland aanleiding tot onweder.

De bewolking was gemiddeld 7,0, het aantal der heldere dagen 2 en der bewolkte 11, geheel overeenkomstig het normale bedrag.

Te Utrecht werden 1 kring om de zon, 1 kring en 3 kranen om de maan gezien.

pression, dont un bras s'étendait sur le nord-ouest de l'Allemagne. Cette dépression amena un vent fort et fut la cause d'un orage aux environs de Gouda. Une dépression peu profonde se dirigea, du 16 au 20 Décembre, du nord de l'Ecosse vers les Pays-Bas, où elle disparut. Le 22 Décembre, apparaissait, à l'est de l'Ecosse, une dépression avec un centre de 730 millim. et un fort gradient. Ce même jour, elle passa le long des Pays-Bas et y occasionna d'abord une tempête du SW puis de l'Ouest. La pression moyenne du vent fut de 36 kilogr. environ; le coup de vent le plus fort à Utrecht, de 60 kilogr., fut observé à 8 $\frac{1}{2}$ heures du soir. Sur les côtes, les coups de vent furent bien plus forts; par exemple, de 111 kilogr. à Flessingue, à 3.15 heures de l'après-midi; de plus de 100 kilogr. à Katwijk, à 6 $\frac{1}{2}$ heures, et au Helder, de 115 kilogr., vers 7 heures du soir.

Après le 28 Décembre, une dépression passa, en diminuant toujours d'intensité, du nord de l'Ecosse par la Norwège, le sud de la Suède, le Danemark, pour disparaître le jour de l'an en Allemagne. Cette dépression produisit des orages, surtout en Frise.

La nébulosité fut en moyenne de 7; le nombre des jours serens, de 2; celui des jours couverts, de 11; ce qui est tout à fait conforme à la normale.

A Utrecht, on vit un halo autour du soleil, un halo et 3 couronnes autour de la lune.

Wilde Sallie bloeit (*Floraïson de Saleia officinalis*). Wehl 30.

JUILLET.

Haagwinde bloeit (*Floraïson de Convolvulus sepium*). Slijk-Ewijk 11.
Wintergerst wordt gezien (*Récolte de Hordeum vulgare*). Finsterwolde 11.
Stokroos bloeit (*Floraïson d'Aster rosca*). Oudheusden 12.
Struikheide bloeit (*Floraïson d'Erica vulgaris*). Zuid-Barge 14.
Hennip bloeit (*Floraïson de Tanobis sativa*). Oudheusden 15.
Erwtten rijp (*Maturité de Pisum sativum*). Oudheusden 16.
Eerste vlas wordt geplukt (*Récolte de Linum usitatissimum*). St. Jac. Parochie 16.
Padden kwaken (*Réveil de Bufo cinereus*). Ingen 19.
Zomerpeer rijp (*Maturité de Pyrus communis*). Oudheusden 19, Kampen 29.
Morel rijp (*Maturité de Prunus arina*). Kampen 19, Oudheusden 21.
Herfstaaappelen in bloei (*Floraïson de Malus tuberosa*). St. Jac. Parochie 20.
Abricosen rijp (*Maturité de Prunus armeniaca*). Kampen 22.
Goudsbloem bloeit (*Floraïson de Cotendula officinalis*). Oudheusden 23.
Rogge wordt gemaaid (*Fauchaison de Secale cereale*). Zuid-Barge 23, Buren 25, St. Jac. Parochie 26, Kampen 27.
Hop bloeit (*Floraïson de Humulus lupulus*). Oudheusden 25.
Zonnebloem bloeit (*Floraïson de Helianthus annuus*). Oudheusden 27.

AOÛT.

Herfstaaappelen rijp (*Maturité de Malus tuberosa*). St. Jac. Parochie 5.
Klokjes gentiaan bloeit (*Floraïson de Campanula trachelidifolia*). Wehl 5.

AUGUSTUS.

- Tarwe rijp (*Maturité de Triticum sativum*). Buren 5, Oudheusden 6, Kampen 13.
 Witte pruimen rijp (*Maturité de Prunus domestica*). Kampen 8.
 Haver gemaaid (*Fauchaison d'Avena sativa*). Oudheusden 9, Buren 30.
 Hennip geplukt (*Récolte de Cannabis sativa*). Oudheusden 11.
 Houtswaluwen vertrokken (*Départ de Hirundo domestica*). Zaandam 12, St. Jac. Parochie 13.
 Haver wordt gezeit (*Fauchaison d'Avena sativa*). St. Jac. Parochie 12.
 Wintertarwe wordt gezeit (*Fauchaison de Triticum sativum*). St. Jac. Parochie 13.

SEPTEMBER.

- Lijsterbes rijp (*Maturité de Sorbus aucuparia*). St. Jac. Parochie 1.
 Bonte kraai aangekomen (*Arrivée de Corvus cornix*). Vlissingen 2, St. Jac. Parochie 24.
 Vierbessen rijp (*Maturité de Sambucus nigra*). Haarlem 3.
 Boekweit rijp (*Maturité de Polygonum Fagopyrum*). Oudheusden 10.
 Rode bes ontbladerd (*Défeuillage de Ribes rubrum*). St. Jac. Parochie 10.
 Wilde ganzen terug (*Arrivée d'Anser cinereus*). Vlissingen 11, Kampen 18.
 Kanariezaad rijp (*Maturité de Plataris canariensis*). St. Jac. Parochie 11.
 Hennip wordt geplukt (*Récolte de Cannabis sativa*). Oudheusden 12.
 Paarsche boonen worden gezeit (*Fauchaison de Faba vulgaris*). St. Jac. Parochie 13.
 Witte druiven rijp (*Maturité de Vitis vinifera*). Kampen 14.
 Eerste vinken uit het Noorden (*Arrivée de Fringilla caelebs*). Wehl 14.
 Houtstaardappelen worden gerooid (*Récolte de Solanum tuberosum*). St. Jac. Parochie 14.

OCTOBER.

- Winterrogge wordt gezaaid (*Semailles de Secale cereale*). St. Jac. Parochie 2.
 Zwaluwen vertrokken (*Départ de Hirundo domestica*). Wehl 2, Zuid-Barge 3.

AOÛT.

- Hop bloeit (*Floraison de Humulus Lupulus*). Oudheusden 15.
 Zonnebloem bloeit (*Floraison de Helianthus annuus*). Oudheusden 16.
 Ooievaars vertrekken (*Départ de Ciconia alba*). Kampen 17, St. Jac. Parochie 23, Groot-Amers 25.
 Zomerappel rijp (*Maturité de Pyrus Malus*). Oudheusden 10.
 De hop maakt bellen (*Maturité de Humulus Lupulus*). Oudheusden 23.
 Platte boonen worden gezeit (*Fauchaison de Faba vulgaris*). St. Jac. Parochie 30.
 Erwtten gemaaid (*Fauchaison de Pisum sativum*). Buren 30.
 Boonen gemaaid (*Fauchaison de Faba vulgaris*). Buren 30.

SEPTEMBRE.

- Rogge gemaaid (*Fauchaison de Secale cereale*). Buren 15.
 Nootboom laat het blad vallen (*Défeuillage de Juglans regia*). Slijk-Ewijk 16.
 Appels rijpen (*Maturité de Pyrus Malus*). Oudheusden 16.
 Hop wordt geplukt (*Récolte de Humulus Lupulus*). Oudheusden 19.
 Lijster aangekomen (*Arrivée de Turdus musicus*). St. Jac. Parochie 20.
 Zwaluwen vertrokken (*Départ de Hirundo domestica*). Slijk-Ewijk 21.
 Tarwe wordt gezaaid (*Semailles de Triticum sativum*). Buren 21.
 Aalbes verliest blad (*Défeuillage de Ribes nigrum*). Oudheusden 21.
 Perzik rijp (*Maturité d'Amygdalus Persica*). Kampen 21.
 Noot rijp (*Maturité de Juglans regia*). Kampen 24.
 Iep laat het blad vallen (*Défeuillage de Ulmus campestris*). Slijk-Ewijk 25.
 Winterperen rijp (*Maturité de Pyrus communis*). Oudheusden 25.
 Slagvinken in troepen aangekomen (*Arrivée de Fringilla caelebs*). St. Jac. Parochie 26.

OCTOBRE.

- Populier laat het blad vallen (*Défeuillage de Populus nigra*). Slijk-Ewijk 3, Zuid-Barge 20, Wehl 20.
 Tarwe wordt gezaaid (*Semailles de Triticum sativum*). St. Jac. Parochie 4, Oudheusden 27.

OCTOBER.

- Bonte kranen terug (*Arrivée de Corvus cornix*). Wehl 5. Zuid-Barge 6, Haarlem 18, Kampen 27.
 Beukepit rijp (*Maturité de Fagus sylvatica*). Oudheusden 5.
 Spreeuwen vertrokken (*Départ de Sturnus vulgaris*). St. Jac. Parochie 8.
 Wintergerst wordt gezaaid (*Semaines de Hordeum vulgare*). St. Jac. Parochie 10.
 Winterrogge komt boven den grond (*Germination de Secale cereale*). St. Jac. Parochie 11.
 Groote muggen zwermen (*Des mouchetons voltigent par essaims*). St. Jac. Parochie 12.
 Wilde zwanen terug (*Arrivée de Cygnus musicus*). Kampen 12.
 De kanadapopulier verliest het blad (*Défeuillaison de Populus monilifera*). Oudheusden 12.
 Kraanvogel vertrokken (*Départ de Grus cinerea*). Wehl 13.
 Zwarte lijster aangekomen (*Arrivée de Tardus merula*). St. Jac. Parochie 16.

NOVEMBER.

- Mispel rijp (*Maturité de Mispilus germanica*). Kaupen 3.
 Het vee verlaat de weide (*Le bétail quitte le paturage*). Kampen 6.
 Bonte kraai terug (*Arrivée de Corvus cornix*). Buren 10.

DECEMBER.

- Boonenstiel bloeit (*Floraison de Lamium album*). Lobit 23.
 Nieskruid bloeit (*Floraison de Helleborus Niger*). Zaandam 24.

OCTOBRE.

- De linde verliest het blad (*Défeuillaison de Tilia europaea*). Oudheusden 17.
 Meikers ontbladerd (*Défeuillaison de Prunus Cerasus*). St. Jac. Parochie 21.
 Wilde gans vliegt (*Passage d'Ancor cinereus*). Oudheusden 21.
 Noteboom ontbladerd (*Défeuillaison de Juglans regia*). St. Jac. Parochie 22.
 Wintergerst komt boven grond (*Germination de Hordeum vulgare*). St. Jac. Parochie 23.
 Pereboom verliest het blad (*Défeuillaison de Pyrus communis*). Oudheusden 25.
 Zwarte bes ontbladerd (*Défeuillaison de Ribes nigrum*). St. Jac. Parochie 26.
 Kers ontbladerd (*Défeuillaison de Prunus cerasus*). Wehl 26.
 Sijje aangekomen (*Arrivée de Fringilla spinus*). Oudheusden 26.
 Wijnstok ontbladerd (*Défeuillaison de Vitis vinifera*). Wehl 28, Oudheusden 31.
 Appelboom ontbladerd (*Défeuillaison de Pyrus Malus*). Oudheusden 29.

NOVEMBRE.

- Riet rijp (*Maturité d'Arundo Phragmites*). Kampen 22.
 Kieviten vertrokken (*Départ de Vanellus cristatus*). St. Jac. Parochie 30.

DECEMBRE.

- Modeliefje bloeit (*Floraison de Bellis perennis*). Ingen 25, Oudheusden 26.

E. JAAROVERZICHT.

1894.

E. APERÇU ANNUEL.

Voor de inrichting en verklaring der hier volgende tabellen wordt verwezen naar de voorrede.

Tabel A. Het jaar 1894 was evenals zijn voorganger, hoewel een kwart graad celsius minder, te warm.

Tot het warmte overschot hebben hoofdzakelijk de wintermaanden bijgedragen. Van de zomermaanden waren alleen April en Juli te warm; April bijna 3 graden celsius.

Evenals de temperatuur was de gemiddelde dampkringsdrukking boven de normale. De grootste afwijkingen in positieven zin vertoonden de maanden September en November. De grootste negatieve afwijkingen gaven de maanden Mei en Juli.

Nous renvoyons à la préface pour l'explication et la distribution des tables suivantes.

Table A. L'année 1894 fut trop chaude, ainsi que la précédente, mais on constata un quart de degré centigrade de moins que dans celle-ci.

Les mois d'hiver surtout contribuèrent à ce surcroît de chaleur. Parmi les mois d'été, on ne peut nommer qu'Avril et Juillet; Avril donner près de trois degrés de trop.

La pression atmosphérique moyenne fut, ainsi que la température, au dessus de la moyenne. Les plus grands écarts positifs furent donnés par les mois de Septembre et de Novembre; les plus grands écarts négatifs, par les mois de Mai et de Juillet.

Tabel B. Aangevende de veranderlijkheid der temperatuur in de verschillende maanden des jaars, geeft duidelijk den invloed aan welke de zee op de temperatuur in ons land uitoefent. Helder en Vlissingen onmiddellijk aan de zee gelegen, geven de kleinste afwijkingssommen. Maastricht het verst van de zee gelegen, heeft de grootste afwijkingssom; daar wijkt dus de temperatuur gemiddeld steeds het meest, hetzij in positieven, hetzij in negatieven zin van de normale af.

B. SOMMEN VAN ALLE AFWIJKINGEN DER TEMPERAATUUR.

SOMMES DE TOUS LES ÉCARTS DE LA TEMPÉRATURE.

Maanden.	Gron.	Leeuw.	Helder.	Utrecht.	Hellevoetsluis.	Vlissingen.	Maastr.	Mois.
Januari . .	341.0	320.8	284.5	358.0	310.9	267.4	360.5	<i>Janvier.</i>

Mart . . .	265.9	227.8	199.3	262.0	252.5	194.2	256.1	<i>Mars.</i>
April . . .	371.0	257.0	225.5	329.2	312.9	272.9	306.1	<i>Avril.</i>
Mai . . .	358.3	275.7	186.3	278.1	308.0	271.6	304.3	<i>Mai.</i>
Juni . . .	395.3	292.9	167.0	221.0	246.0	215.3	259.5	<i>Jun.</i>
Juli . . .	242.5	140.2	140.7	229.3	225.4	191.1	275.0	<i>Juillet.</i>
Augustus . .	167.4	191.5	183.4	206.4	215.0	190.5	229.6	<i>Août.</i>
September . .	186.1	157.1	175.6	198.0	194.1	227.1	255.4	<i>Septembre.</i>
October . . .	191.0	191.5	170.4	215.9	194.5	205.5	267.5	<i>Octobre.</i>
November . .	235.8	236.9	257.9	272.6	301.8	217.5	305.9	<i>Novembre.</i>
December . .	194.7	206.8	225.8	211.5	311.6	189.9	167.5	<i>Décembre.</i>
Tot.	2936.1	2699.7	2401.0	3128.7	3141.5	2710.8	3362.4	<i>Tot.</i>

Tabel C. De sommen der afwijkingen van de noordelijke plaatsen zijn alle groter, dan die van de zuidelijke plaatsen van ons land, doordat de noordelijke plaatsen dichter gelegen zijn bij de banen, waar langs de depressies zich het talrijkst voortbewegen.

Tabel D. Vierenzeventigmaal wisselde de barometer-afwijking van teeken. Gemiddeld duurde een afwijking dus bijna vijf dagen. De langste positieve afwijking duurde 18, de langste negatieve afwijking 16 dagen.

Den 29^{de} November trad een lage barometerstand in, welke onafgebroken 30 dagen lang aanhield, met een gemiddelde negatieve afwijking van ruim 10 mm.

Tabel E. Cette table, qui donne la variabilité de la température dans les divers mois de l'année, montre clairement l'influence de la mer sur la température dans notre pays. Le Helder et Flessingue, qui sont situés au bord de la mer, donnent les plus petites sommes d'écarts, tandis que Maastricht, qui est le plus éloigné de la mer, présente la somme d'écarts la plus grande. Aussi voit-on qu'à Maastricht, la température s'écarte le plus en moyenne de la normale, soit en plus soit en moins.

C. SOMMEN VAN ALLE AFWIJKINGEN DER LICHTDRUKING.

SOMMES DE TOUS LES ÉCARTS DE LA PRESSION ATMOSPHÉRIQUE.

Tabel C. Les sommes des écarts dans les stations du nord de notre pays sont toutes plus grandes que celles dans les stations du sud, parce que les stations du nord sont plus rapprochées des routes le plus fréquemment suivies par les dépressions.

Tabel D. L'écart barométrique a changé soixante-quatorze fois de signe. Ainsi la durée moyenne de chaque écart a été de cinq jours environ. L'écart positif le plus long dura 18 jours; l'écart négatif le plus long, 16 jours.

Le 29 décembre, commença une basse pression barométrique qui se maintint sans discontinuation pendant 30 jours, avec un écart négatif moyen de plus de 10 millimètres.

Table E. La température ne présenta pas de grandes variations. Un écart se maintint en moyenne pendant sept jours. L'année commença par le froid et finit par la chaleur. Les plus grands écarts positifs se présentent au printemps et en automne; les plus grands écarts négatifs, en été. En Février et Mars, la température fut pendant 20 jours

April 25 dagen achtereen boven de normale. De laagste positieve afwijking, van 29 dagen, gaven October—November.

In Augustus was het 24 dagen, van den 7^{ten} tot den 30^{sten}, achtereen te koud.

consécutifs au-dessus de la normale; en Mars et Avril, ce fut aussi le cas pendant 25 jours consécutifs. Le plus long écart positif, de 29 jours, se présenta en Octobre et Novembre.

Au mois d'Août, 24 jours consécutifs, du 7 au 30, furent trop froids.

Tabel F. Het jaar 1894 was zeer nat. De jaarlijksche gemiddelde hoeveelheid werd te Utrecht met 251.1 mM. overschreden. Vooral Februari, Juli en Augustus waren zeer natte maanden. Februari gaf weder veel regen, maar toch niet zooveel als het jaar te voren. Te Groningen werd het jaargemiddelde met 79.4 mM. overschreden. De zomermaanden Juni, Juli en Augustus waren daar zeer nat.

Tabel G. Uit deze tabel blijkt, dat de jaarlijksche regenhoeveelheid voor de verschillende plaatsen van het land zeer uiteenloopt. De grootste hoeveelheid regen 965.7 mM. viel te Leeuwarden, de geringste te Maastricht 588.7 mM. Een verschil van bijna 400 mM. Vooral de zomermaanden waren zeer nat in het gehele land, maar voornamelijk in de noordoostelijke provincien. Te Ruinen (Drenthe) viel in de maand Juni 269.5 mM. regen.

Table F. L'année 1894 fut très humide. La quantité moyenne de pluie à Utrecht fut dépassée de 251.1 millimètres. Les mois de Février, de Juillet et d'Août surtout furent très humides. Il tomba de nouveau beaucoup de pluie en Février, moins cependant que l'année précédente. La moyenne annuelle fut dépassée à Groningue de 79.4 millim.; les mois d'été, Juin, Juillet et Août y furent très humides.

Table G. Cette table montre que les quantités de pluie qui sont tombées dans les diverses stations du pays, diffèrent beaucoup. La plus grande quantité de pluie, 965.7 millim., est tombée à Leeuwarden; la plus faible, 588.7, à Maastricht, ce qui donne une différence de près de 400 millim. Les mois d'été surtout furent très humides dans tout le pays, mais principalement dans les provinces du nord-est. A Ruinen, province de Drenthe, il tomba 269.5 millim. de pluie dans le seul mois de Juin.

Tabel H. Zoolen gewoonlijk verdampte er te Utrecht iets meer dan te Helder, welke plaats meer aan de vochtigheid der zee blootgesteld is dan eerstgenoemde plaats. Te Helder verdampte des daags ruim tweemaal zooveel als des nachts. Aldaar is de verdamping des nachts grooter dan te Utrecht, gedurende dienzelfden tijd.

H. VERDAMPING. — ÉVAPORATION. 1894.

Tabel K. De SW- en W-winden kwamen ongeveer tweemaal zooveel voor als die uit tegenovergestelde richting. De S- en SE-winden wegen ongeveer in aantal op tegen de N en NW.

Table H. Ainsi que d'ordinaire, l'évaporation à Utrecht fut un peu plus forte qu'à Helder, station qui est plus exposée à l'humidité de la mer que la première. À Helder, l'évaporation pendant le jour fut plus de deux fois plus grande que pendant la nuit, tandis que l'évaporation pendant la nuit y est plus grande qu'à Utrecht.

Een ongunstig verschil — de luchtdrukking in een zuidelijke plaats grooter dan in een noordelijker gelegen plaats — van meer dan vier m.M. werd van de 67 maal waarop zich dat voordoed, 48 maal door storm gevolgd.

Driemaal kwam het voor dat men niet door het verschil gewaarschuwd was, en dat er toch storm volgde. De storm was in geen dier drie gevallen hevig.

Viermaal volgde op een gunstig verschil storm. Hierbij moet echter in acht genomen worden dat dit driemaal plaats greep onder den invloed van een naderend stormcentrum, en eenmaal gedurende een onwéershui, welke van een hoos vergezeld ging.

Une différence défavorable, c'est-à-dire lorsque dans une station du sud la pression atmosphérique est plus élevée que dans une station du nord, de plus de quatre millimètres, sur 67 fois qu'elle se présente fut suivie 48 fois d'une tempête.

Trois fois une tempête se déclara sans qu'on eût été averti par la différence, mais dans aucun de ces cas la tempête ne fut violente.

Quatre fois il arriva qu'une différence favorable fut suivie d'une tempête, mais cela se présenta trois fois sous l'influence de l'approche d'un centre de tempête et une fois pendant un orage accompagné d'une trombe.

Datum, waarop een ongunstig verschil in de barometer-waarnemingen
of een storm van dertig of meer kilogrammen op den
vierkanten meter voorkwam.

*Dates avec un gradient défavorable ou une tempête de trente
kilogrammes ou plus par mètre carré.*

Tabel **M**. De dagelijksche gang der temperatuur staat in nauw verband met de helderheid van den hemel. Hoe geringer de bewolking, hoe meer de temperatuur gemiddeld in den loop van den dag stijgt.

Table **M**. La marche diurne de la température est dans un rapport étroit avec la sérénité du ciel. Plus la nébulosité est faible, plus aussi la température s'élève en moyenne dans le courant de la journée.

**M. GROOTTE VAN DEN DAGELIJKSCHEN GANG DER TEMPERAATUUR
NAAR DE HELDERHEID.**

Division VII.

MAGNETISCHE WAARNEMINGEN.

OBSERVATIONS MAGNÉTIQUES.

Aardmagnetische Waarnemingen.

Overeenkomstig het in het vorige Jaarboek uitgesproken voornemen, wordt dit jaar een aanvang gemaakt met het mededeelen van de uitkomsten der photographische opteekening van de variaties der horizontale intensiteit.

Het daarvoor in den magnetischen kelder opgestelde instrument, bestaat uit een magneetnaald, die door twee deflectormagneten een stand loodrecht op den magnetischen meridiaan inneemt, zoodat de variaties der declinatie geen invloed op dien stand hebben. Aan de magneet hangt een halfcirkelvormige spiegel, die het lichtbeeld op het photographisch papier werpt en boven den vasten, (ook halfcirkelvormigen) spiegel, die de basislijn geeft, zweeft.

Achter de spleetvormige opening tusschen die twee spiegels is een smalle spiegel aangebracht, waardoor een derde lichtpunt op het papier wordt te voorschijn geroepen. Deze laatste spiegel is aan een met vloeistof gevulde Bourdon'sche buis bevestigd en beweegt zich evenredig met de temperatuur, zoodat op het photogram een derde lijn verschijnt, die de verandering in de temperatuur aangeeft.

Deze thermograaf is eerst den 12^{ten} Januari 1894 in dienst getreden: de temperatuurveranderingen op de eerste 12 dagen van Januari, zijn aan de opteekeningen van een gewonen, dichtbij het instrument opgesteld, Richard'schen thermograaf ontleend.

Volgens bepalingen gedaan vóór den aanvang, en gedurende het jaar 1894, is de waarde van 1 m.m. op het H-photogram:

$$dH = 0.0000283 \{ n' - 1.644 (m - m_0) - n'_0 \} \text{ (C. G. S.)}$$

waarin n' en m de aflezingen zijn resp. van de H- en de temperatuurkromme en n'_0 en m_0 hare normaalwaarden.

Observations sur le magnétisme terrestre.

Ainsi que nous en avons témoigné l'intention dans le dernier Annuaire, nous commençons cette année à donner les résultats des notations photographiques des variations de l'intensité horizontale.

L'instrument placé dans la cave magnétique se compose d'une aiguille aimantée, à laquelle deux aimants deflecteurs font prendre une position perpendiculaire au méridien magnétique, de sorte que les variations de la déclinaison n'ont pas d'influence sur cette position de l'aiguille aimantée. A l'aimant est suspendu un miroir semi-circulaire, qui projette l'image lumineuse sur le papier photographique, et se trouve au-dessus du miroir fixe, aussi semi-circulaire, qui donne la ligne de base.

Derrière la fente, entre ces deux miroirs, on a placé un miroir étroit, qui donne un troisième point lumineux sur le papier. Ce dernier miroir est fixé à un tube de Bourdon rempli de liquide, et son mouvement, proportionné à la température, fait apparaître sur le photogramme une troisième ligne, qui indique le changement de température.

Ce thermographe n'a été mis en service qu'à partir du 12 Janvier 1894: les changements de température pendant les 12 premiers jours de ce mois ont été empruntés aux indications d'un thermographe Richard ordinaire, placé tout près de l'instrument.

D'après des déterminations faites avant le commencement de 1894 et pendant cette même année, la valeur de 1 millim. sur le photogramme H est:

$$dH = 0.0000283 \{ n' - 1.644 (m - m_0) - n'_0 \} \text{ (C. G. S.)}$$

équation dans laquelle n' et m représentent les lectures respectives de la courbe H et de celle de la température; n'_0 et m_0 leurs valeurs normales.

De reductie der photogram-aflezingen voor H en D, is geheel op dezelfde wijze geschied, als voor de declinatie in het Jaarboek voor 1893 is beschreven.

De veranderingen in den normaalstand van de variatie-instrumenten in het ijzerrij gebouw, zijn door de absolute bepalingen bepaald.

La réduction de la lecture des photogrammes pour H et D s'est faite tout à fait de la manière indiquée pour la déclinaison dans l'Annuaire de 1893.

Les changements dans les indications normales des instruments de variation dans le pavillon magnétique, ont été déterminés au moyen des déterminations absolues.

Bij de declinatie is een jaarlijkse schommeling zeer duidelijk, (zij heeft zich gedurende het nu reeds verstreken jaar 1895 inderdaad herhaald) en door middel van een graphische voorstelling, is een regelmatig verloop dier schommeling verkregen.

Une oscillation annuelle de la déclinaison est très distincte. Elle s'est en effet présentée de nouveau dans l'année qui vient de s'écouler (1895). On a obtenu le marche régulière de cette oscillation au moyen d'une tracé graphique.

Bij de horizontale intensiteit is zulk een schommeling niet te ontdekken, en is eenvoudig voor het geheele jaar het nagedeelde gemiddelde $\Pi = 0.18392$ gebruikt. Hoewel de inclinatie ook een schommeling vertoont, is wegens het te beperkte aantal waarnemingen, evenzo 't gemiddelde $67^{\circ} 21'.4$ gebruikt.

De tabellen met de uurwaarden zijn op dezelfde wijze, als die der declinatie voor 1893, ingericht; alleen is als laatste een nieuwe kolom: «karakters» toegevoegd. Hierin geeft een cijfer het karakter van de photographische kromme van dien dag aan.

Hierbij is in hoofdzaak het in Potsdam gevolgde stelsel aangenomen.¹⁾

Karakter 1. Zeer glad verlopende krommen, normaal in den zin van Wild.

- » 2. Krommen met rustig verloop, dat door kleine golven niet onhuideijk wordt.
- » 3. Licht gestoorde krommen; de secundaire golven zijn van matige grootte en niet langen duur (1—3 uren).
- » 4. Tamelijk gestoorde krommen; de secundaire golven zijn vrij groot en van langen duur.
- » 5. Heftig gestoorde krommen (magnetische storm).

Voor eenige opvallende gevallen zijn aan een dag twee cijfers toegevoegd en in een noot het uur van overgang aangegeven.

Voor de gevallen, waarbij een magnetische storm plotseling als 't ware met een stoot begon, is het oogenblik van die stoot nauwkeurig bepaald en in aanmerking genomen de uitstekende tijdsdeeling op de photographieën en de herhaaldelijke vergelijkingen der pendule met de hoofdpendule der Utrechtsche Sterrewacht, kunnen deze oogenblikken tot op een halve minuut nauwkeurig aangenomen worden.

Wanneer onwaardig, wegens fouten in de registrering ontraken, is met behulp van de maandgemiddelden alleen dan geïnterpoleerd, wanneer de dag een rustig karakter vertoonde; in geval van storing is

Dans l'intensité horizontale, on n'a pas observé d'oscillation de ce genre, et l'on s'est simplement servi pour toute l'année de la moyenne mentionnée, $\Pi = 0.18392$. Quoique l'inclinaison présente aussi une oscillation, on s'est aussi servi de la moyenne $67^{\circ} 21'.4$, vu le nombre trop restreint des observations.

Les tables des valeurs horaires sont semblables à celles qui ont été données en 1893 pour la déclinaison. On a seulement ajouté une colonne avec la suscription: «caractères», dont le chiffre indique le caractère de la courbe photographique du jour indiqué.

Nous avons suivi ici en grandes lignes le système d'annotation de Potsdam.¹⁾

Caractère 1. Courbes très unies, normales dans le sens de Wild.

- » 2. Courbes à marche tranquille, qui n'est pas rendue indistincte par de petites ondes.
- » 3. Courbes légèrement troublées; les ondes secondaires sont de grandeur modérée et de peu de durée (1 à 3 heures).
- » 4. Courbes assez fortement troublées; ondes secondaires assez grandes et de longue durée.
- » 5. Courbes violemment troublées (orage magnétique).

Dans quelques cas frappants, on a donné deux chiffres pour le même jour; une note donne alors l'heure de la transition.

Dans les cas où un orage magnétique a commencé pour ainsi dire d'un seul coup, le moment exact du commencement est indiqué, et, vu l'excellente division du temps sur les photographies et le contrôle répété de la pendule avec la pendule principale de l'Observatoire astronomique d'Utrecht, ce moment peut être indiqué exactement, à une demi-minute près.

Lorsque les valeurs horaires manquaient, par suite de fautes d'enregistrement, on ne les interpolait au moyen des moyennes mensuelles que lorsque le jour avait présenté un caractère calme; lorsqu'il y a eu

¹⁾ Ergebnisse der Magnetischen Beobachtungen in Potsdam in den Jahren 1890 und 1891. Berlin 1894. (V. Veröffentlichungen des Königlich Preussischen Meteorologischen Instituts). Cf. pag. 1.

(V. Veröffentlichungen des Königlich Preussischen

slechts een vragteeken ingevuld. De uurwaarden, die door directe aflezing in het ijzerrij gebouw zijn verkregen, zijn van een nulletje in plaats van een sterretje voorzien.

Verder is de dagelijkse gang nog in de componenten loodrecht op- en langs den geographischen meridiaan omgezet en in de beide laatste tabellen opgenomen.

De waarnemingen in het ijzerrij gebouw zijn, behoudens het bovenvermelde, op dezelfde wijze als 't vorige jaar bewerkt en de middelwaarden voor 2^o P.M. volgen hieronder.

un orage magnétique, on n'a mis qu'un point d'interrogation. Les valeurs horaires obtenues par la lecture directe dans le pavillon magnétique, portent un petit zéro au lieu d'un astérique.

Les deux dernières tables donnent encore la marche diurne en composantes, l'une perpendiculaire, l'autre parallèle au méridien géographique.

Les observations dans le petit bâtiment ont été réduites de la même manière que l'année dernière, sauf ce que nous avons mentionné plus haut, et nous donnons ci-dessous les valeurs moyennes pour 2^o P.M.

Over den jaarlijkschen gang der temperatuur te Vlissingen

DOOR

Dr. VAN RIJCKEVORSEL.

Sur la marche annuelle de la température à Flessingue

PAR

M. le Dr. VAN RIJCKEVORSEL.

Jaarlijksche gang der temperatuur te Vlissingen.

Voor de berekeningen waarvan de uitkomsten hieronder volgen kon ik beschikken over de waarnemingen te Vlissingen van 1855 tot 1892. Echter vormen deze jaren verre van *eene* homogene reeks. Op het Koninklijk Instituut herinnert men zich nog, dat, na eenige waarnemingsjaren eene andere plaats voor den thermometer gekozen is, omdat men meende dat hij aangedaan werd door de uitstraling van omringende voorwerpen; indien ik mij niet bedrieg, vooral van een muur die bovenmatig door de zon verwarmd werd. Doch het is niet mogelijk geweest, aanduidingen te vinden omtrent het jaar, waarin die overbrenging heeft plaats gehad. Verder is in 1889 de zelfregistreerende toestel begonnen te werken in gebruik is, wat eene opstelling der instrumenten heeft noodig gemaakt, geheel verschillende van wat vroeger bestond.

Het eerste jaar, 1855, is door wijlen den Hoofddirecteur BEYS BALLOT verworpen. Ten minste de reeks die hij gebruikt heeft voor zijne gemiddelden *) gaat slechts van 1856 tot 1875. Men moet vermoeden, dat hij de uitkomsten van dat eerste jaar minder betrouwbaar vond. Zon het al op het einde van 1855 geweest zijn, dat men den thermometer het al op het einde van 1855 geweest zijn, dat men den thermometer met de zeer praktische bedoeling meter verplaatst heeft? Of wel zou hij, met de 24 waarover hij beschikken om slechts te werken met 20 jaren van de eerste jaar hebben weggekon, bij voorkeur, gelijk natuurlijk is, het eerste jaar laten? Ik weet het niet. In elk geval, bij vergelijking der uitkomsten van dat jaar met de einduitkomsten kan ik geene innerlijke aanleiding tot verworping vinden. En dan, waar ik reeds over de cijfers van 38 jaren

Marche annuelle de la température à Flessingue.

Pour les calculs dont je vais donner les résultats, j'avais à ma disposition les observations faites à Flessingue depuis 1855 jusqu'à 1892. Ces années cependant sont loin d'offrir une série homogène. On se rappelle encore à l'Institut royal que, après quelques années d'observations, on a choisi une autre exposition pour le thermomètre, croyant qu'il était affecté par la radiation d'objets avoisinants; si je ne me trompe, surtout d'un mur que le soleil chauffait outre mesure. Cependant, il a été impossible de trouver des indications sur la date où ce transfèrement aurait eu lieu. Puis, en 1889, a commencé à fonctionner l'appareil enregistreur qui sert maintenant, ce qui a occasionné un aménagement des instruments, très différent de celui qui existait auparavant.

La première année, 1855, a été rejetée par feu le Directeur en chef BEYS BALLOT. Du moins, la série qu'il a employée pour ses moyennes *) ne va que de 1856 à 1875. Il faut présumer qu'il jugeait les résultats de cette première année moins satisfaisants. Serait ce déjà vers la fin de 1855 qu'on a transféré le thermomètre? Ou bien, dans le but tout à fait pratique de n'opérer que sur vingt des vingt et une années dont il pouvait disposer, a-t-il, comme de raison, laissé de côté la première? Je ne sais. En tout cas, en comparant les résultats de l'année en question avec le résultat final, je n'ai pu trouver aucune raison intrinsèque pour la condamner. Aussi, pouvant déjà disposer des résultats de 38 années, j'ai jugé que, même si les chiffres pour 1855 étaient un peu sujets à

*) Marche annuelle du thermomètre et du baromètre en Néerlande. Institut royal météorologique des Pays-Bas. Utrecht 1876.

*) Marche annuelle du thermomètre et du baromètre en Néerlande. Institut royal météorologique des Pays-Bas. Utrecht 1876.

kon beschikken, meende ik, dat, zelfs indien de cijfers voor 1855 iets minder betrouwbaar mochten zijn, de invloed daarvan niet groot genoeg meer kon zijn om tot verwerping te nopen.

Het kwam mij dienstig voor, de resultaten te geven voor 8 uur d. m., 2 en 8 uur d. n., omdat de langste waarnemingsreeks voor die uren gold. Maar ook in dit opzicht is de reeks verre van homogeen. Gedurende de eerste negen jaren werd dan eens des morgens te 7 in plaats van te 8 uur waargenomen, dan weder op den middag en te 3 ure in plaats van te 2 ure, of wel alleen op den middag. De avondaflezingen zijn eerst in 1864 begonnen, maar daarna zijn er weder eenige jaren waarin zij te 7 in plaats van te 8 ure gedaan zijn. Eindelijk had ik voor de laatste vier jaren de cijfers voor al de uren van den dag, uit de diagrammen getrokken.

Dus moesten er een groot aantal berleidingen aangebracht worden om onderling vergelijkbare uitkomsten te verkrijgen. Ik kon natuurlijk de noodige gegevens trekken uit de uurwaarnemingen der laatste jaren.

Voor een zeer klein aantal dagen ontbraken de waarnemingen, of zij waren onvolledig. In die gevallen heb ik waarden ingeschoven, zoo goed mogelijk door interpolatie verkregen. Daar het aantal dezer geïnterpoleerde cijfers ver beneden de honderd blijft voor een totaal van meer dan 37.000, geloof ik, dat het niet de moeite waard is, uitvoerig uit te leggen, hoe die interpolatie gedaan is.

Ten slotte had ik dus ter beschikking eene reeks van 29 jaren (1841—'92) waarvoor ik voor elken dag drie gegevens had, en van 9 jaren (1855—'63) waarvoor ik slechts de temperaturen te 8 uur d. m. en te 2 ure had.

Voor elken dag van het jaar is het gemiddelde voor elk der drie uren afzonderlijk genomen. Dus is voor 8 uur des nam. elk gemiddelde het resultaat van 29 waarden, voor de beide andere uren, van 38. Het zijn deze gemiddelden die men voor elke maand van het jaar in de eerste drie kolommen der tabel zal vinden. De vierde kolom geeft het gemiddelde der eerste drie, en dus de gemiddelde temperatuur voor elken dag, voor zover deze werkelijk gegeven wordt door het gemiddelde van die drie uren. Aan den voet van elke dezer kolommen vindt men het gemiddelde voor elk der drie uren en van den dag voor elke maand van het jaar.

caution, leur influence ne pourrait plus être assez grande pour justifier leur rejet.

Il s'a parn pratique de donner les résultats pour 8 heures du matin, 2 et 8 de l'après-midi, parce que la plus longue série d'observations avait été faite à ces heures-là. Mais, à cet égard aussi, la série est loin d'être homogène. Pendant les neuf premières années, tantôt on prenait les lectures à 7^{heures} du matin au lieu d'à 8^{heures}, une autre fois on observait à midi et à 3^{heures} au lieu de la faire à 2^{heures}, tantôt on le faisait à midi seulement. Les lectures du soir n'ont commencé qu'en 1864, mais après cette année, il y a encore une série d'années où elles ont été prises à 7^{heures} au lieu de 8^{heures}. Enfin, pour les quatre dernières années, j'avais des chiffres pour toutes les heures de la journée, tirés des diagrammes de l'appareil enregistreur.

Il a donc fallu appliquer un grand nombre de réductions pour avoir des résultats comparables entre eux. J'ai naturellement pu déduire les données nécessaires des observations horaires des dernières années.

Pour un très-petit nombre de jours, les observations manquaient où étaient incomplètes. Dans ces cas là, j'ai intercalé des valeurs obtenues aussi bien que possible par interpolation. Comme le nombre de ces valeurs interpolées reste bien au dessous d'une centaine sur un total de plus de 37.000 chiffres, je crois qu'il ne vaut guère la peine d'expliquer au long, suivant quelle méthode ces interpolations ont été faites.

Je pouvais enfin disposer d'une série de 29 années (1841—'92), pour lesquelles j'avais trois données pour chaque journée et de 9 autres années (1855—'63), pour lesquelles je n'avais les températures que pour 8^{heures} du matin et 2^{heures} du soir.

Pour chaque jour de l'année, la moyenne a été prise séparément pour chacune des trois heures. Ainsi, pour 8^{heures} du soir, chaque moyenne est le résultat de 29 valeurs; pour les deux autres heures, de 38. Ce sont ces moyennes qu'on trouvera, pour chaque mois de l'année, dans les trois premières colonnes de la table. La quatrième colonne donne la moyenne des trois premières et, par conséquent, la température moyenne de chaque jour, pour autant que la moyenne de ces trois heures donne réellement la température moyenne de la journée. Au bas de ces colonnes, on trouvera la moyenne pour chacune des trois heures de la journée et la moyenne de la journée même pour chaque mois de l'année.

Om de maanden meer gelijk te maken, zijn 31 Januari en 1 Maart bij Februari gevoegd, welke aldus op 30 dagen gebracht is, daarentegen is met den 29^{sten} Februari in schrikkeljaren geen rekening gehouden.

Naar deze gegevens is de eerste lijn van het diagram getrokken, de gebroken lijn. Op deze lijn hebben betrekking de temperaturen ter linkerhand van de eerste verticale lijn.

Dit diagram bewijst duidelijk, dat de reeks gegevens nog veel te kort is, om volstrekt goede normaltemperaturen te verstrekken. Nog veel minder kunnen deze gemiddelden als normalen gelden, als men het reeds vermelde feit in rekening brengt, dat wij in werkelijkheid slechts bezitten drie afzonderlijke reeksen van waarnemingen. Overigens weet men sinds lang, dat, althans voor onze breedten, eene veel langere serie nog niet voldoende is, om definitieve normalen te geven.

Er bleef dus de keus over, welk middel ik zou toepassen om iets meer te naderen tot de meest waarschijnlijke normalen; m. a. w. om de hokkesprongen der verkregen lijn te doen verdwijnen, zonder gevaar te loopen, onregelmatigheden uit te wischen die misschien werkelijk bestaan. Want het is niet onwaarschijnlijk, dat de kromme welke de werkelijke normalen zou voorstellen eenige van de bijzonderheden zou vertoonen die thans door de grillige vormen der lijn worden bedekt.

Het komt mij voor, dat de verkregen uitkomsten niet definitief genoeg zijn om de tijdroovende becijfering te wettigen, die noodig zou zijn om eene theoretische lijn te verkrijgen, welke zeer veel kans zou hebben toch de ware niet te zijn. Want, bij al het reeds gezegde moet hebben gevoegd worden, dat de afzigen verricht zijn door een zeer afwisselend personeel, wat eene nieuwe bron van onzekerheid is.

Dus heb ik er mij toe bepaald de eenvoudigste methode te gebruiken. Dus heb ik er mij toe bepaald de eenvoudigste methode te gebruiken. Dus heb ik er mij toe bepaald de eenvoudigste methode te gebruiken. Dus heb ik er mij toe bepaald de eenvoudigste methode te gebruiken. Dus heb ik er mij toe bepaald de eenvoudigste methode te gebruiken.

Met behulp dier gegevens is de lijn getrokken die uit kleine streepjes bestaat, en die tusschen de zig-zags der eerste lijn doorslingert. Ik heb het getal van 9 dagen genomen, omdat dit den grondslag uitmaakt van

Pour égaier les mois, le 31 Janvier et le 1^{er} Mars ont été ajoutés au mois de Février qui est ainsi porté à 30 jours, par contre, il n'est tenu aucun compte du 29 Février dans les années bissextiles.

C'est d'après ces données qu'a été tracée la première ligne du diagramme, la ligne brisée. A celle-ci correspondent les températures notées à gauche de la première ligne verticale.

Ce diagramme prouve suffisamment que la série est encore beaucoup trop courte pour donner des températures normales absolument justes. Ces moyennes déduites peuvent encore moins être prises comme normales, si l'on tient compte du fait déjà énoncé, que nous ne possédons en réalité que trois séries différentes d'observations. Il y a longtemps du reste que nous savons que, dans nos latitudes du moins, une série bien plus longue encore ne suffit pas pour donner des normales bien définitives.

Restait donc à décider de quelle manière je m'y prendrais pour m'approcher un peu plus des normales probables; en d'autres termes, pour effacer les caprices de la ligne obtenue, sans courir le danger de trop effacer des irrégularités peut-être réellement existantes. Car il n'est pas improbable que la courbe qui représenterait les vraies normales n'offrit encore quelques-unes des particularités cachées par les sauts brusques de la ligne.

Je ne crois pas les résultats obtenus assez définitifs pour justifier le calcul assez fastidieux qu'il faudrait faire pour obtenir une ligne théorique, qui aurait beaucoup de chances de n'être pas la vraie après-tout. Car, il faut encore ajouter à tous ce qui a déjà été dit, que les lectures ont été faites par un personnel d'observateurs où il y a eu beaucoup de mutation, ce qui introduit une nouvelle cause d'incertitude.

Je me suis donc borné à suivre la plus simple des méthodes. Dans la cinquième colonne de la table, on trouvera, pour la moyenne de chaque jour, une nouvelle valeur, obtenue en substituant à la valeur tirée directement des observations, la moyenne des neuf jours dont le jour en question occupe le milieu.

C'est à l'aide de ces données qu'a été tracée la ligne dessinée en petits traits, et qui serpente dans les zigzags de la première. J'ai choisi le nombre de neuf jours, parce qu'il forme la base d'une méthode de

eener berekenings-methode om eene geleidelijke kromme te verkrijgen, welke indertijd door BUYS BAILLOT is voorgesteld.¹⁾ Zoo zullen de cijfers uit deze kolom altijd kunnen dienen, indien men ooit deze methode wil toepassen.

Deze kromme nu is kennelijk nog te gebocfeld om als eene goede benadering van de normaallijn te kunnen gelden. Na eenige proeven is het mij voorgekomen, dat de beste weg was, de cijfers der 5^e kolom nog eens vijf aan vijf te middelen. Den uitslag dezer bewerking vindt men in de 6^e kolom van elke maand. Daar stelt dus het cijfer voor elken dag het gemiddelde voor der vijf waarden in de vorige kolom, waarvan die dag de middelste plaats inneemt.

De kromme die uit deze laatste gegevens voortspruit is in stippels getrokken. Om het diagram niet onduidelijk te maken is de gehele kromme zooveel lager gezet als met de waarde van twee graden overeenkomt. Op deze kromme hebben dus betrekking de cijfers rechts van de eerste ordinat.

Men zou uit deze kromme willen afleiden, dat ook de laatst besproken waarden nog niet geheel als normaaltemperaturen kunnen gelden. Zij is zeker nog te veel gekrouweld. Echter meen ik, dat door nog verder op dezen weg voort te gaan, men gevaar zou loopen, onregelmatigheden uit te wischen die werkelijk bestaan, en dat het beter is, zich voorloopig met het verkregen resultaat tevreden te stellen.

Voor elke maand zal men in de tabel eene zevende kolom vinden, met het bovenchrift BR. Het zijn de gemiddelden, vroeger door BUYS BAILLOT gegeven. Niet dat hij deze cijfers geeft. Doch op pp. 45—47 van het reeds aangehaalde werk²⁾ vindt men de gemiddelden voor de drie uren van elken dag, dezelfde uren waarvoor mijne gemiddelden gelden. De cijfers mijner zevende kolommen zijn direkt uit deze gegevens getrokken.

Ik cordeeelde het onnut, ook de lijn die deze cijfers voorstelt geheel

calcul pour obtenir une courbe continue, jadis exposée par BUYS BAILLOT¹⁾. Ainsi les chiffres de cette colonne pourront toujours servir, si l'on veut appliquer plus tard cette méthode.

Cette courbe est évidemment encore trop irrégulière pour être considérée comme une bonne approximation à la courbe normale. Après quelques essais, il m'a semblé que le meilleur procédé serait de prendre encore une fois cinq à cinq les chiffres de la cinquième colonne. Le résultat de cette opération se trouve dans la sixième colonne de chaque mois. Le chiffre pour chaque date représente donc, dans ces colonnes, la moyenne des cinq valeurs de la colonne précédente dont cette date occupe le milieu.

La courbe qui résulte de ces dernières données a été tracée au pointillé. Pour ne pas trop compliquer le diagramme, toute la courbe a été transportée à une distance correspondant à deux degrés. Donc cette courbe doit être rapportée aux chiffres à droite de la première ordonnée.

Cette courbe fait croire que ces dernières valeurs ne représentent pas encore tout à fait les températures normales. Elle est certainement encore trop mouvementée. Cependant je crois, qu'en poussant encore plus loin le procédé suivi, on risquerait de masquer des irrégularités qui existent réellement, et qu'il vaut mieux se contenter provisoirement du résultat obtenu.

On trouvera, pour chaque mois, dans la table une septième colonne, portant en tête BR. Ce sont les moyennes données jadis par BUYS BAILLOT; non qu'il donne ces chiffres-ci, mais, aux pages 45—47 de l'ouvrage précité²⁾, on trouve les moyennes pour les trois heures de chaque journée, les mêmes heures pour lesquelles valent mes moyennes. Les chiffres de mes septièmes colonnes sont tirés directement de ces données.

Je n'ai pas cru utile de dessiner aussi toute la courbe qui représen-

de gang der temperatuur te Vlissingen veel beter voorgesteld worden — ten minste voor deze beide maanden — door deze golvende lijn, dan door eene, die waarschijnlijker zou kunnen schijnen, omdat zij een meer regelmatig hielop had.

Voor het overige verschillen de gemiddelden voor elke maand, gelijk zij blijken, hetzij uit mijne cijfers, hetzij uit die van BUIS BALLOT, zeer weinig, daar het grootste verschil weinig meer dan $0^{\circ}.4$ bedraagt. En het jaargemiddelde, dat volgens BUIS BALLOT $10^{\circ}.61$ zou moeten zijn, is, volgens mijne cijfers $10^{\circ}.50$.

Deze zoo zeer kleine verschillen doen wel vermoeden, dat wij van goede normaalwaarden zoo ver niet meer af zijn.

la température à Flessingue serait beaucoup mieux représentée par cette courbe accidentée — du moins pour ces deux mois — que par une courbe qui pourrait sembler plus vraisemblable, étant plus régulière.

Du reste, les moyennes de chaque mois, telles qu'elles résultent, soit de mes chiffres, soit de ceux de BUIS BALLOT, diffèrent très-peu; la plus grande différence ne dépassant guère $0^{\circ}.4$. Et la moyenne de toute l'année, qui, d'après BUIS BALLOT, devait être de $10^{\circ}.61$, est, d'après mes chiffres, de $10^{\circ}.50$.

Ces différences si minimes font bien présumer que nous ne sommes plus bien loin d'avoir de bonnes normales.
